Attachments Accounting Fulfillment Loop - Backlog Planning

Meeting records Transcript

Summary

The backlog planning session involved a detailed review of user stories and workflows for the accounting fulfillment group's portion of the next sprint, aiming to improve operational efficiency by allowing customers to close the loop between inventory operations and accounting transactions in Method. Participants discussed user stories related to sales order to invoice conversion, ensuring no inventory impact when creating an invoice or bill, and refining the design for selecting delivered items for billing, including adding location and date information to the selection modal. The team decided to keep the delete button visible on partially delivered sales orders that are invoiced, displaying a restriction message, as suggested by Method Junction over Barbara Stevenson's suggestion of removing it, and agreed on the need for both UI and backend validation for deletion and undo actions, resulting in two separate tickets for sales orders and purchase orders. Key investigations were identified for handling service/non-inventory items in the invoicing flow, managing QuickBooks Online status updates via EDA, and addressing purchase order deletion conflicts with books syncing.

Details

- **Backlog Planning Meeting Introduction and Scope**: The planning session focused on the next sprint's backlog, which involves the accounting fulfillment group portion of the workflow. The goal is to delve deeper into user stories and workflows, looking for unknown spikes, proofs of concept (PC's), and opportunities to break down deliverables into smaller, shippable chunks (00:00:00). The problem statement addresses the inability for customers to close the loop between inventory operations and accounting transactions in Method without manually reconciling fulfillment workflows with financial records, leading to operational inefficiency (00:02:11).
- **Review of Sales Order to Invoice User Story (No Inventory Impact)**: The first user story discussed focuses on ensuring that saving an invoice in Method has no impact on inventory balances, specifically stating that inventory stock levels (quantity on hand, committed, expected) should not be affected when an invoice is created in draft status (00:03:19). It was confirmed that there are no inventory locations to consider in this context for invoices or bills (00:04:37).
- **Sales Order to Invoice Conversion Workflow**: A user story was reviewed regarding the conversion of a sales order into an invoice, where the new invoice should include selected delivered items so customers can be billed for items already shipped (00:04:37). This process involves a modal that populates with all delivered, non-invoiced items when the "create invoice" button is clicked, allowing the user to select items and be redirected to the invoice screen with pre-filled details. The team confirmed that deliverables can be made as small as needed for testing and shipping, as long as they can be worked on and shipped (00:05:59).
- **Detailed Sales Order to Invoice Design Review**: The design for the sales order to invoice flow includes adding an "invoice" column (Yes/No) to the item delivery table, which triggers a modal allowing users to select their account receivable and choose non-invoiced delivered items (00:07:18). After selection and saving, the user is redirected to the invoice screen where quantity and rates are non-editable, transferring information from the delivery (00:08:22). The team decided to add another column to the modal to include location and date information to help users differentiate between multiple deliveries of the same item (00:43:14).

- **Discussion on Inventory Location and Accounting**: The team confirmed that inventory locations are not being linked or shown on the invoice screen, meaning users must return to the sales order to find location details if they have multiple invoices for the same item from different fulfillments (00:08:22). It was clarified that the account drop-down should only show Accounts Receivable (AR) accounts and that the logic for stock adjustments and accounts does not apply in the same way to this invoice flow (00:10:41).
- **Clarification of Sales Order Status Updates**: The team discussed the definitions for sales order invoicing progress, defining "partially invoiced" as when at least one item in the delivered items table has not been invoiced (00:10:41). "Invoiced" applies when all delivered items have been invoiced, and this status will be tied to the sales order, not the invoice itself (00:12:22). A functional requirement (FR) was recognized as confusing due to the abbreviation, and the speaker agreed to update "functional requirements" to "user stories" within the acceptance criteria (00:14:36).
- **Review of Deletion Restrictions for Sales Orders**: A user story addresses the restriction on deleting a partially delivered sales order if delivered quantities are invoiced, requiring the linked invoice to be deleted first (00:16:37). The conversation focused on whether to hide the delete button entirely if an order is partially invoiced or to show the button and a message confirming the deletion restriction (00:23:49). Barbara Stevenson suggested removing the delete button and documenting the caveat in the help center, but the team later agreed to keep the delete button visible with a message, supporting the preference of Method Junction (00:25:18).
- **Validation Strategy for Deletion and Undo Flows**: The team discussed the need for both UI (frontend) and backend validation for deletion and undo actions, acknowledging that only using backend validation via action execution errors would make the experience disruptive for UI users (00:18:42) (00:29:01). The team decided to stick with the current approach of having both UI and backend validation, which will result in two tickets (one for UI changes and one for backend changes) for deletion and undo workflows for both sales orders and purchase orders (00:22:42) (00:31:45).
- **Investigation of Non-Inventory and Service Items**: A concern was raised regarding how invoicing service or non-inventory items affects the deletion restrictions, as these are not delivered items (00:33:00). The speaker agreed to research how invoicing service and non-inventory items should work when

inventory is enabled, specifically concerning how it affects the sales order status and validation (00:34:46) (00:54:28).

- **Need for Subtasks and Prerequisite Work**: The team identified the need for several subtasks, including implementing the UI and backend validations, and confirmed that Keshka would create subtasks where needed within the tickets (00:39:48). It was also confirmed that an investigation (spike) is needed to determine how purchase order deletion should handle books syncing conflicts, requiring confirmation on whether to override books data (00:30:32) (00:36:15).
- **Purchase Order to Bill Conversion and Statuses**: The purchase order to bill conversion is similar to the sales order to invoice workflow, ensuring no inventory impacts occur when creating a bill (00:44:24). Similar to sales orders, there are deletion and undo restrictions on purchase orders linked to a bill, and the purchase order list screen should display "not billed," "partially billed," and "billed" statuses (00:46:53).
- **Transaction Conversion and Out-of-Scope Work**: Conversion flows from opportunity/estimate to invoice and from sales order to purchase order were reviewed. The conversion from sales order to purchase order was deemed outside the current sprint's theme, as it relates more to back-ordering and order fulfillment, and it was suggested to move that work to Kanban (00:48:17).
- **QuickBooks Online (QBO) Status Impacts and EDAs**: An investigation is required to determine how sales order and purchase order accounting statuses should update if an associated invoice or bill is deleted in QBO (00:50:42). This involves confirming if EDA (Event-Driven Architecture) is implemented for QuickBooks accounts, which would allow for the auto-update of the sales order invoicing status upon deletion of an invoice in QBO (00:51:51).
- **Final Review of Action Items and Next Steps**: The speaker committed to adding all user stories and acceptance criteria to the respective high-level workflows and updating the ticket terminology from "FRs" to "user stories" (00:52:56). The team concluded the meeting, having identified the primary requirements, necessary splits (specifically UI/validation and stock changes/backend), and necessary investigations (spikes) for the upcoming sprint (00:54:28).

Suggested next steps

- [ ] Method Junction will create a user story to reuse or hide the "Create Invoice" button when it's enabled for inventory to make the flow clear.
- [ ] Method Junction will update the acceptance criteria of tickets by changing "FR" to "User Stories" and including the respective user stories for clarity.
- [ ] Method Junction will add a column for date to the modal workflow for invoicing items to differentiate between deliveries of the same item.
- [ ] Method Junction will research how to invoice service or non-inventory items when inventory is enabled and if that impacts the sales order's invoicing status.
- [ ] Method Junction will talk to Barbara Stevenson about the sales order to purchase order conversion workflow, as it is related to backordering and order fulfillment.
- [ ] Method Junction will check with devops to confirm whether QuickBooks accounts data is ready for use in implementing the invoicing status updates, as this is needed for updating sales order invoicing status upon invoice deletion in QBO.

Accounting Fulfillment Loop - Backlog Planning - Transcript

00:00:00

Method Junction: happening before. Um 101 start. Okay, you start. Um so yeah, this is our backlog planning meeting for our next sprint being that accounting fulfillment group portion um of the workflow. Uh previously we did the right scoring for uh these user stories high level workflows that the sprint is aiming to achieve and now um backlog planning is I believe to go deeper into these workflows into the user stories and I did already uh write up the the PR uh p goes over the problem space the solution space success metrics and um explains the what and the why and the functional requirements. Um, I'm new to backlog planning. So, uh, Grange, how how do we go about doing this specifically? Uh, so we're looking for unknown spikes, PC's, um, anywhere we can break things down into smaller deliverables. Gotcha. Okay. So then uh do you want me to just walk through each user story? Uh sure. Yep. Okay. Um so before we go into it, I just want to make sure the entire team's aligned on what problem this sprint is actually solving.

00:02:11

Method Junction: So we'll just read over the problem statement. So uh customers cannot cannot close the loop between inventory operations and accounting transactions in method. Without a structured connection between sales order and purchase order fulfillment and invoices and bills, businesses must manually reconcile fulfillment workflows with financial records. Uh creating operational inefficiency and breaking the order cash cycle. Um so today the workflow is connected but it's not connected based on what's already been delivered or received. It's just based on um the items and the items not shipped or items not delivered table. But the workflow that we're deliver uh we're trying to um ship is um an accounting piece that you only account what's already been invoiced and received which is inventory is industry standard. Um so the workaround today when we ship inventory management is you have to manually

reconcile accounting and inventory fulfillment. Um so it's breaking the order cash cycle is what which is what I said right here. So this is just to streamline the entire approach and make it quicker for our customers.

00:03:19

Method Junction: Um so that so we would be creating a invoice or a bill based off of the post itself. Yeah, that should happen for the ones that are already uh build or invoiced the sales for the purchase for existing customer. Oh, we we not going to change any of that. That's we're keeping those in the same. of it. And how would the customer know if it was actually posted and an invoice versus just a sort of email? I mean, then we have to go through the entire process of reconciling previous transactions here, right? We we don't know, right? Nothing nothing is connected today, right? So, this is only forward facing like into the future new transactions. That is expected. Expected. Yeah. Expected. Okay. So, um, so the first user story, there's not that many. Um, but we can go get through these. Uh, the first one is, as a user, I want saving and invoice and methods to have no impact on methods inventory balances so that inventory stock levels, method, quantity on hand, committed, expected, or made not affected.

00:04:37

Method Junction: Basically no impact quantity in stock committed expected or inventory tracking analysis when invoice is created. What does this status mean draft status? Okay, status draft. So this is just referring to the user story in in general. We haven't gone through them together. So once we've gone through them, I can update the status to like uh something else like approved or something along those lines. And then design is we have the actual link to the design for that user story. So you can it's it's tied exactly now. So it's a lot easier to reference. Yeah. So do we have any like unknowns here um that we might need to investigate more of? Okay. Thank you. And we do not have locations on inventory or invoice on bills, right? Yeah, no locations. Okay. Uh, next one is, as a user, when I convert a sales order into an invoice, I want the new invoice that includes selected delivered items so that I can bill customers for items that have already been shipped.

00:05:59

Method Junction: Um this is kind of going over that uh the modal workflow that we mentioned. Uh the modal would populate when you click the create invoice uh button. The modal will show all items that have been delivered that have not yet been invoiced. And then from there you can choose which items you want to invoice to the customer. Uh from selecting those uh items um and clicking confirm, you're redirected to the invoice uh with the customer details. link sales order for reference. Quantity to delivered equals quantity to sold um unit rate um basically similar to what we do today. Similar to how we go from item not delivered to delivered the same kind of it's also similar to how we already have that conversion workflow, but now we're just looking at the delivered items that haven't been invoiced. Yeah. By the way, when we're looking at um deliverable breakdowns, um we're no longer limited by everything has to be a date, right? So, conceptually think of we can make things as small as we want, but they should be things that we work on and ship that can be test could be really small, could be larger.

00:07:18

Method Junction: All that's all fine. Uh can you go to the link in the design? Yes. Yeah. Each one of these user stories is a ticket. Um uh I didn't create these into user story into tickets. Yeah. Okay. But that's that's the idea, right? That's the idea here. So we're looking for can these be broken broken down and delivered into smaller chunks or not. Okay. Yeah. So this is the sales order screen we have today. So item delivery table. Uh the new column we would add is the invoice column which basically informs us if no yes. No means this item has not been invoiced. Yes means the item has been invoiced. So when the user clicks create invoice here uh there a modal opens up. You can choose your account receivable account from this dropdown and this uh grid populates with um all the items that have not been invoiced from the delivered table. The user would select so there's no input fields.

00:08:22

Method Junction: The user would just select click save. Then they're redirected to the invoice screen um with basically all the same information. the quantity uh the amounts here are equal to the quantity sold and the rates and all that is just the same information

we're transferring over and that that is the entire flow. So once the invoice is created, this screen would update to show uh whether the line item has been invoiced or not with yes or no. And then the item list screen which I'll show sorry the other list screen for the sales order list screen which show um whether it's partially invoice fully invoice based on the items in that delivery table. Okay. Um for the modal to the invoice flow. Yeah. uh modals have locations because it's based up the fulfillment line. Do we save that to the like on the English screen? Are we showing the location or We're not we're not we're not even like linking those, right? Yeah, we're not. Yeah. No. So, how would they know like if they have two invoices of let's say the same item for two different fulfillments, how would they know which invoices for which one?

00:09:38

Method Junction: Like how would they know? uh they would they would have to go back to the sales to see which location. Okay. Yeah. And uh if this select an item Yeah. they would be able to completely invoice it, right? Yeah. You're invoicing the entire amount entire quantity. Exactly. So you can't you can't change this to something else. So this is non-editable. Non-editable. You're just selecting which rows they as well as is nonedible. Non editable. You can change all this here if they want. Okay. Yeah. Question account. So if you go to rob. Yeah. Um since the items when we're creating it I don't which screen we updated it. We're getting the new added part. Uh we are having a drop down all of them. Does it stock adjustment which has um a drop down which has like accounts receivable so that's all the different accounts. Yeah.

00:10:41

Method Junction: All of the different accounts right? Yeah. That's stock adjustment or that that's stock adjustment. Okay. So if the account should only show yeah those only the AR account. What if for example they do a stock adjustment for location right item and they select that location they want it here. Oh, you mean they want that account here? That location? Yeah. They will have to go and then to make another stock in adjustment to update that location to have this or is that Nove that doesn't function the same way here? That doesn't No, you just uh the stock adjustment is just recording uh the transa that transactional account which could be any account, right? income inventory AR account um tied to that adjustment in a specific location. The location and

the account are not like does that make sense? Yeah. Yeah. the same. So for this ticket we it's only UI then right just creating the model screen and making sure the flow goes from sales to and then also in status update and then you mention is partially yes so partially it's when there's at least one item in the item not delivered items delivered table that hasn't been invoiced yet.

00:12:22

Method Junction: So you have not invoiceiced. Okay. Partially invoice and then and then invoice. Invoice isn't all items are invoiced. Uh this invoice isn't you're talking about the sales order invoice status not the Okay. Yeah. Yeah. So the invoice itself won't have a status. The sales order would have accounting like invoice orders. So this have another problem. Yeah. Yeah. I found my uh where I put it. Does not have something to do with something already. Yeah, I'll get to the user story. I haven't from from UI perspective like as I was asking if sales order to invoice uh is converted Mhm. today. Mhm. you would need to hide that, right? Yeah. So, is there a story for that to hide that? Oh, um this would just be for when it's enabled for inventory. We would uh I I didn't have a user story for that. I can create one.

00:13:28

Method Junction: I the you the create purch invoice button would just be redirecting to this modal screen instead of that screen. You know what I mean? Yes. But the button needs to be hidden, right? button itself. We're going to create invoice. Yes, because then there will be two invoice buttons. Oh, yeah. I thought we can we just reuse the same button. Maybe. Oh, that's okay. So, can you add the story to reuse it if you want to reuse it or hide it if you want to hide it? Yeah. As from product perspective. Sure. Yeah, we can. Yeah, I can do that just to make it more clear. Yeah, this story is just going over into more depth about uh sales order status to automatically like invoicing progress um and the just different conditions on how uh whether inventory impacts happen which they shouldn't happen uh stat how statuses change and updated. Didn't we had rice scoring through a bunch of these tickets already?

00:14:36

Method Junction: Yeah. So the right scoring was at the high level like this is me breaking it down. Why didn't you just add it to the same tickets like these user stories into the same? Yeah. Okay. So they technically are linked already. Um it's just weird back and forth. Okay. Because right now I do have I do have the FRS which reference this story. Okay. So they are linked like that. Okay. Sure. I don't know if you guys want to do this. Yeah. I mean, copy and paste is fine. Yeah. Okay. So then I can just uh if that's the case and the acceptance criteria, I can just put the FRS with the user with the AC. Then FR is a feature request, right? Uh functional requirements. Sorry, that's too confusing. Confusing because we have FS in in uh Jira. They're called feature requests. Okay. Then I'll change this to user story.

00:15:32

Method Junction: User stories. Sure. Yeah. I'll change to user stories. Okay. So then I'll put the user stories in the acceptance criteria with the AC. Yeah. Okay. Makes sense. Cool. Um um so the ticket that we just talked about would be the updating this itself because then would change the scoring or probably something like that, right? How many screens have to change? Yeah, it would be based on this. It would be based on this ticket itself. Okay. Yeah, we we went through this and the requirements here are literally the user stories going through right now. So I think I think right scoring is just to help us identify stuff to bring in the GR. uh we can go back and update it if we find it's off. If that maybe changes stuff we want to take out of the sprint maybe if it's more complex and then this is actually way more difficult than than we thought based off requirements that weren't there before.

00:16:37

Method Junction: If it's if it's small there's going to be changes as we we dig in every time. So, I don't know if we want to always go back and change the right score unless it unless we really feel it's this is something way different than than what we had. Yeah. Okay. Um and as I'm going through this, I noticed that for sales orders, this should be fine. I'm assuming for the purchase orders and we're talking about them parallel. Um are are there would we be going through purchase orders separately like a different sprint?

Not a different sprint but in the story points user stories. So yeah that's a that's its own workflow too. Oh yeah that's why like when we broke it when we did the right scoring this is for sales order invoice conversion workflow and then we had to build conversion workflow. Yeah exactly. Um yeah. So then this one's related to as a user it wants to delete a partially delivered sales order only when no delivered quantities are invoiced.

00:17:44

Method Junction: Um so basically if there's an invoice that's tied to a sales order you cannot delete it unless you delete the invoice linked to the sales order first. So there there's a deletion restriction. Now that's the validation the validation. I think this is already in place. Yeah. I I kept it here because we just want to make sure that it it works. Um, one thing I do want to bring up is release confirmation. Um, that would be a separate UI we're adding in, I guess. Uh, oh, like this one release on confirm. Uh, sorry. Show release. This one. Yeah, because right now we don't have that. We' be adding this in at the show message right up there trying to delete it. Yeah. Basically check if it's invoice. If it is, show this deletion. Yeah, exactly. Okay, that's what we have today, I believe. Right. The deletion messages. So messages. Yeah, for deletion, we just have a one, I believe.

00:18:42

Method Junction: We have multiple multiple things. Yeah, you have multiple for the different uh sales order statuses. Um same for POS as well but in theory but then um this for invoicing what I wanted to ask was uh let's say they confirm it we want to see a sorry if we could scroll up on the confirmation message is this.3 yes uh is this a separate message from the actual validation like are we blocking it in front end and back Um so basically okay so this the one you're looking at right now is uh given a partial sales order is not linked to an existing invoice then we would show this message and then um uh we would release on confirmed uh but when we're when we're restricting uh we show this uh order message. So one or more delivered items are linked to an invoice to delete this order please delete all associated invoices first. Um, so you're saying should this be both a UI and a validation? Yeah, because right now it's just an AE. Yeah, this you Oh, this you're saying this is a Yeah, right now it's an A. Oh, okay.

00:19:56

Method Junction: So, do we want to have it at a UI as well? That would add like something we need to add in. Um, if we add add it in the UI, would both of them show or no? No. I mean, if we block it via UI, then no. preparation copy stop action stop processing we'd have to do checks ahead of time then if it's invoice stop processing actions because that validation only fires when we actually try deleting it from the back end and then the back end's like hey you can't do that okay um because if we do it from UI it would be more work on the next gotcha how much more work are we talking about have couple actions. We have to check the loop to the grid or get any all the things that are invoiced and then based on that have a show message. Yeah, I feel like this should be on the UI. So it's less disruptive with the AE customer um for all of these. Then the thing is there would be a difference between how it works for an REST API or an import users versus our current UI users.

00:21:16

Method Junction: That's the reason why first thought was to add all of the validations on the back end as action installation errors. Um I would definitely suggest that the rest API import and the UI say stay in sync. Okay. But are you thinking of rest API? define yesterday can show a different message versus UI needs to show a different message. We're doing that today with couple other workflows that would be great to keep them consistent and also there's a scenario where we cannot validate before saving the data. We cannot loop through a grid before we save the grid. Mhm. So any validation we would need to first save it then check and then unless and until it's on back end on front end we can do that if we want to but it's not that easy to we'll just change the scope of the size of use story we'll change the requirements but like would it break it down into multiple deliverables, multiple tickets, it's still just one one thing we're shipping. Are you looking for like prerequisite work or spike work?

00:22:42

Method Junction: Uh oh. But from a from a requirement standpoint, are we looking for a

UI validation or a backend validation? Like that's a requirement specific, right? We could have both. Yes. Because I think for a lot of the flows we do have both. So then let's stick to the same thing. Yeah. Yeah. So then yes to deliverables rest API and import users will be faced with a validation instead of like the UR. Yes. Yeah. Okay. We'll keep that and any custom users I know we are saying that yeah they might custom I believe customization will be initiated. Yeah. Any customizers. Yes. Okay. So this will be two tickets now, right? Two tickets. And then this one, uh, as a user, I want to delete a fully delivered sales order only if no delivered quantities have been invoiced. Um, yeah. So you can only delete a fully delivered. So it's just a delivered order if there's no invoice linked to any of the delivered items.

00:23:49

Method Junction: So same as the last one, right? Yeah. Fully delivered. Exactly. And then we would show this message. Deleting this delivered order will return the delivered quantities to each link location and stock balance which we already have today. But now we have that added. There's no invoices currently. Yeah. So we have to check that. Uh so are we allowing to delete the sales order itself if there's one invoice already associated to it or No. So if there's one if one of the line items are invoiced then you can't delete it. You can't delete the order because the sales order itself would be partially invoiceed. Exactly. So what we would be adding a validation for is if the sales order is partially invoiced. Yeah. Don't allow but then why are we showing the delete button in the first place? So partially invoiced. Um it's partially invoice. Why are we showing the lead button? Good question. I mean would then maybe it's easier maybe it's easier just to remove the the weather then we just hide it if it's partially invoiceless right yeah that's true we can just do that then and that means then we wouldn't have UI and the validation here that would that would show the UI validation would not yeah backend validation we still should put it in because rest API import and customizers would to be blocked.

00:25:18

Method Junction: Yeah. But for stock apps, yeah, we do not. The reason that I bring this up is so that you can break it down better. Yeah. Yeah. Yeah. Yeah. I'm thinking like I think I believe the reason why I we added this in the first place was that um I know the

help center would help here. Um this just some added information to the customer so that they understand that they can't delete it since it's already linked. Let me uh Barbara, are you there?
Barbara Stevenson: Yeah.
Method Junction: Yeah. What do you think about this? Like, should we uh keep the delete button if it's been partially invoiced and then show a message to the customer
Barbara Stevenson: Yep.
Method Junction: that they can't deleted or should we just remove the delete button entirely if it's been partially invoiced and then um then the user is unable to delete it?
Barbara Stevenson: I think we could do the ladder and just point it out at the caveat in the help center.
Method Junction: Okay, cool.

00:26:17

Method Junction: So then I'll just remove this. Um, yes. I I still think you should have a delete button that says you can't delete because if the delete button just disappears after from the customer experience that could be that they feel what we can do is possibly add it in documentation. So that way we don't have bunch of people saying I can't do this you know I want to delete work it's it's making happy
Barbara Stevenson: Yeah.
Method Junction: that's the documentation and then if it comes down to it or something like Sorry. Um, this is related to undoing. So, as a user, I want to undo delivered uh sales order items only if they have not been invoiced. So, you can only undo items that haven't been invoiced. Now, right now, we can undo anything. And now, the restriction is only undo invoice items. You can undo. So we do have all these and back validation. Uh I guess for most of these my question would be the same like if you want front end UI that looks different for UI and have both then obviously you'll add time to the tickets.

00:27:54

Method Junction: Yeah. Um because right now this is being Yeah. We should add the Okay. So for any undue uh just Yeah. I guess specify within which tickets it would be. Okay. But yeah, we would need to uh take into account that time it would take to you know add in that show message and do the manual action sets. Okay. Uh in this case

then it would be better to contain the scope action execution error at first for all of those and then specifically just adding validations for any of the UI that we want to add validation for. And this would be in the sprint sprint. Yes. But then deliverables can be split up and in the page go we just have action execution errors. Mhm. But then once uh those are out it's just the UI changes just the stock apps changes that need to update. Um I feel like we should shift it with the UI uh take on the additional time. Yeah.

00:29:01

Method Junction: Seeing the actual action execution error when attempting these workflows uh is a is very destructive. And you're just talking about order of releasing. You're saying release the you want socks things first then the back back end. Yeah. Yeah. Back's already out. Technically it's there. Uh it would just be the UI that needs to be implemented and um invoicing status. Sorry, the invoicing status. Uh we need to add EDA to calculate the invoicing status and then add that in the validations to confirm that the invoicing status field. Okay, I see. So that is not payment yet. So the validation does have some invoicing where invoicing there is an invoicing status column. we have a violation where if it's invoiced you can't um delete it and if it's invoiced you can't un so these are two separate systems one one sub ticket would then be the stock exchanges one would be the back because they're not dependent on each other totally separate should be tested individually that's how we identify how to break stuff down for SLN was uh SN No, not like existing ones.

00:30:32

Method Junction: Yeah. So, we're adding something technically new. Yeah. Yeah. Um, so purchase orders is completely different or is it similar? They're like they're basically identical. It's just you're looking at two different things. So for purchase orders, what should happen if they delete the purchase order conflicts? Uh, we were talking about that, right? we would go like a erroring conflict or right that's what you and Rich were talking about. So we would have to that that is definitely we would need to investigate people into that. Yeah. Yeah. Yeah. Uh because there is a button to just override whatever books gives us. Yeah. Just put it in. Yeah. So we would have to confirm that. Yeah. Uh that's a spike for sure. Okay. So, who's running down the the spikes and the and the the uh splits right now or the changes? I mean, right now I have everything with

AI recording.

00:31:45

Method Junction: Okay. So, we just uh so at the end we'll verify I guess that works. Okay. Better than having to type it out. But I hope Well, assuming he gets everything right. Yeah. because I won't remember what I discussed. Yeah, that's a good point. You know, I just point helps too. Okay. Okay. So, just a sec. Which one did we decide to split on? Um, basically all like UI and validations or any of those show me ones. Uh, specifically undo and delete. Yeah, undo and delete. Yes. For both sales orders and purchase orders. Yes. Uh and for um question so invoice instead what if they have an invoice and create another invoice that sales have allowed because I think we can do that today. Um yeah yeah that's fine. That's fine. Yeah that's fine. Yeah, you can have uh as many invoices to one sales order.

00:33:00

Method Junction: Um, now I think there's an additional condition that we would need to add. What if they just invoice service or non-inventory items? Technically, they should be able to delete this list. We just invoice Noah because it's not connected at that point. You know what I mean? Because like you're only because you're not delivering service and not inventory items, right? So the delete is only in respect to delivered items. So the the user would have to invoice manually for service and non-inventory items. So then in that case we would need to show the delete button if it's just service and noninventory items. Yeah. As in Yes. Right. Because they are still invoiced. So technically we do not want to change in this case what will happen is on sales orders we have let's say first is inventory item second is non inventory third is service item yeah I click on create invoice yeah and only select those two which are non inventory and service an invoice is created but the status of the sales order is is it partially invoiced invoiced or nothing um It would be partially but the user wouldn't be able to choose service or not items anyways but okay if we were to invoice yeah a sales order yeah without just sales just

00:34:46

Method Junction: uh service and non inventory I'm not even using inventory items on sales order. Yeah. How do I invoice that with ML enabled with inventory enabled? Yes. You wouldn't be able to No, it wouldn't be able that was expected. No, I didn't I I missed that one. I'm not too sure if that was expected or not. I have to look deeper in that. Yeah, look deeper. Yeah, I need to do more research on that question though. So, uh and okay, so UI validation back end validation that needed to be split up. We also mentioned that investigation for uh books will book uh syncing and these I know currently sales orers do not sync but basically it would be us tying our tying hands of connecting if they decide to sync sales orers tomorrow. Yeah. So it needs to be in direct. Yeah. Yeah. If the tomorrow decide that hey sales order needs to be synced all of our inventory workflow should not break.

00:36:15

Method Junction: Yes. They shouldn't break. Yeah. So we would think that hey sales orders will be syncing at some point of time. Yeah. Yeah. Right. Yeah. And the same then deleting sales orders from the folks. Yeah. We would look at purchase orders. Yes. Yeah. And how should it work? Okay. Yeah. So these stories are just related to the undying edge cases. Um and so as a user I want the sales order stats to automatic automatically reflect this program's progress ensuring accounting states are respected so I always have an accurate real-time view of whether an orders open partially delivered or delivered based on its inventory state. So um yeah so given order is fully delivered when a user performs an undue action for one or more delivered items that are non-invoiceiced uh those undone items are moved back to the item not ship table. the sales order status changes from fully delivered to partially delivered. So what we have today but just how invoices pair with this as well.

00:37:45

Method Junction: What are what are the actual use cases like as a user I I do this produces X. So sounds like the you have the user story is actually a goal but actually how they interact with it. Is it fully is it just within the app? Is it outside of the app? Uh this is all within uh the sales order. It seems like uh our app updates did have some

errors and maybe just they paused the pause the blown up. So I have to look at it after this. What's that? After this take a look. It doesn't seem like it's affecting customers as far as I can tell. It shouldn't. It's not customer I can know we can put automation on it just automation. You can manually turn on Yeah. Yeah. So then yeah, this user story is just about the sales order list view having invoice statuses along with order statuses. So uh not invoice partially invoice and invoice just based on the order itself.

00:39:48

Method Junction: Back up. Yeah. Is this thing like open the top one? Exactly. Yeah. I'll show you right now. Yeah. Yeah. Exactly. They should retroactively update as things change when we do Facebook. So, who's who's going to update the tickets with the requirements for shipping the changes? Is it is it John? Is it us? I don't think that's really clear. Well, I'll update the ticket with each uh user stories that under each workflow um like who's creating subtasks. Not too sure that's me. Yeah, I don't think it should be John. Yeah, maybe Keshka. Yeah. Okay. So create subtask out of these where we where we need where we need them. Yes. Okay. Some of them might not like yeah yeah open. Okay. So they can partially deliver uh a particular sales order line. They can have multiple deliveries itself right and then they can invoice it.

00:41:26

Method Junction: So that is one way they can have smaller invoices. Yeah. Exactly. Well you can have 10 delivered items. You can have 10 invoices you want. Yes. Yeah. Exactly. Or not just 10. You can have 100 because each and every line item you can just deliver one out of 10 quantities. Yeah. I'm talking from the items delivered table when you're invoicing because you're delivering you're invoicing the entire delivered amount. So it's one it's technically one entry line item in the invoice. So if you select if you have 10 delivered items, you know what I mean? Okay. But you know how it works today, right? You have different deliveries for every. So let's assume that there's only one inventory item on the safe. Yeah. Yeah. With 100 quantities. Yeah. First create a delivery for just 10 items out of those 100. Yes. The second time you create a delivery Yeah. It's a second delivery.

00:42:19

Method Junction: Yeah. Yeah. In the lines, I think we show two different lines. We do not total out. Yeah. Two different lines. Yeah. Yeah. I'm just saying in the items delivery table, if you have like, let's say, 10 different rows, that's 10 opportunities to be invoiced. Yes. That's what I'm looking at. For the same item, it doesn't matter. Yeah. We're talking about the same thing. Okay. Because if there are two deliveries with the same item and same quantity. Yeah. It's not like the customer is looking to think hey you want this delivery to be invoiced rather than this delivery to be invoiced. Right. Example 17 like 15th of February I created a delivery for the same items and 10 quantity. On 16th of February I created 10 quantities. Same delivery same item. Mhm. Now when I'm trying to invoice on the 17th of February, I'm trying to see which one should I invoice.

00:43:14

Method Junction: In that case, it might not be user friendly for the customer to know which delivery they want to invoice because the item quantity, rate, amount, everything's the same. Yeah. Yeah. I know what you mean. Yeah. So we are expecting that. Yeah, we're expecting that. Yeah. So from the modal they're going to see the same line entry if that's what they did. If that's what they did. Yeah. Yeah. If they want for date to differentiate not I think I don't remember actually that's we could add here. Uh maybe take out the location and have date. We don't have much location. Oh yeah, because location does not move as much DM use here because we're doing a counting down. Um but now hold up the delivery was for location. Okay. Yeah, you're right. So location and date. So we need another column here. We would add another column. Please leave a comment.

00:44:24

Method Junction: All right. Cool. I'm just add So I think I probably missed this, but this doesn't have any invoice line. Like if it's invoiceed, we don't show it here. Exactly. No. Uh so Okay. As in if the fulfillment line was invoiced, we don't show it on this. Yeah. Fulfillment line. Yeah. Fulfillment line, not item fulfillment. No, no, like the fulfillment line. And yeah. Yeah. So like these two have not been invoiced, so these two will show up here. But this my item has been invoiced, so this won't show up here. Okay. Exactly.

Okay. All right. And then um now we're kind of we're transitioning from sales orders to invoices to bills and purchase orders. So like when I say it's similar, it's basically similar. I'm taking like exact copies here. So no inventory impacts when you create a bill. There shouldn't be any inventory impacts on how we track stock in method today.

00:45:30

Method Junction: Method stock, right? Yeah. Exactly. Yeah. That will continue but meth stock should not be impacted. Um. Exactly. So this is the conversion from uh purchase order into bill. It's it's the same logic. So things that have been received um you can build them. If they've already been build they don't you can't uh build them again in the modal workflow. So you go to the link here, we can view it and also include the date column as well. Um yeah, you have the items received and then you have the the modal workflow here. So we add another column here. It's also you can you can choose your AR account and you just select which items you want to build. Once you select and click save, you're transferred to the bill screen. I guess it should be a notable. Yeah. Yeah, you're right. You're right. Um, and it looks like the thread uh map did provide some Yeah.

00:46:53

Method Junction: That's basically that. Um so I'm assuming the similar types of um subtasks would also apply applicably to purchase orders as well, right? With one addition that that unknown unique to Yeah. How books should Yeah. And these are just based on how statuses should change. Um, similar stuff. Okay. Yeah. And then we also have the deletion and undo flow. So you can't delete what's already been built. Um, you have to delete the link the bill first before deleting a purchase order. So, similar to sales orders and um the undo flow as well, you can't undo what's already been built. Yeah. Yeah. And then you also have the build status on the build uh on the sort of list screen. So, not build, partially build, and then build. And we have the designs linked so you can just quickly reference them as well. And then uh we have the transaction conversion flows. So um this one just real quick.

00:48:17

Method Junction: Okay. Yeah. So this one as a user I want to convert an opportunity or estimate into an invoice. I want a new invoice to carry over those items quantities so that the invoice can be saved. I believe nothing is changing here. We're not touching this uh workflow but I just kept it here so that we know that workflow still works at design. Um, this one, yeah, so this one's from converting a sales order into a purchase order. Um, it's a whole workflow. We don't have designs here yet. Um, I was going to talk to Barbara about this one. Uh, but this one possibly could be this one could be its own user store, like its own uh something we can do in Canvan or we can uh yeah, we probably do this one in Canvan. So we can keep the current sprint interest accounting and this was more would this would be related to more back ordering and um order fulfillment. Okay, then we we could explore that because this one would just be adding a new modal workflow ordering more items for our sales ordering.

00:49:20

Method Junction: Um that would just be that workflow there. It it doesn't fit with the theme of the sprint. It doesn't No, it's it doesn't fit with it. Okay. Yeah. Were there any other like small bugs or um feature requests that did sit with the sprint theme? So I didn't have a chance to look at any bugs in the backlog yet. Feature requests I haven't seen any related to this but bugs there possibly could be bugs uh related to conversion maybe on the invoice sales screens where or other screens we could look into. I can try finding those. Yeah. Yeah. So yeah, I think for this user story, uh, we can have this as a part of canban instead. So let's just skip that for now. Okay. Yeah. So this one, so as a user, when I convert an invoice into a purchase order, I want the new purchase order to include selected items that I can order items I need to invoice. So, uh, yeah, these ones probably can be its own can related to us because they're not really related to sales to u accounting per say.

00:50:42

Method Junction: So, I'll quote these ones. A question for this though, even though it's not here, when we go invoice to appeal, yeah, do we need to manually select locations in the PO, right? Yeah. Yeah. Yeah. We're not having an intermediate screen or anything. It's

just the items that appeal and then they select the location. Yeah. Items in the PO. So, basically what we're working here with validations or that would apply here. And then yeah this is just transaction duplication duplication should work for invoices and bills how it works today. So nothing should change there. And then status impacts from QBO. So this is related to some of the investigation we have to do. But if an invoice or bill linked to a sales order purchase order and method was deleted in TBO when those changes sync to method then the accounting status related to the sales order and purchase order should update accordingly. Yeah. So, and then we have a bunch of nonfunctional requirements that relate to performance, reliability, and a bunch of other areas.

00:51:51

Method Junction: Um, that the last ticket, the last story. Yeah, there it does have a little bit to do with how PDA is currently worked on. Uh, I think they did push it to QuickBooks accounts. There are a few accounts that it has been implemented on but I will have to confirm with devops to check if that is actually we can start using that. Sure. Yeah. Because in that case what will happen is the invoice it will be deleted from QuickBooks. It will come down and then it should ideally auto update the sales order. Yeah. Invoicing status. Yeah. For sure. So we are talking about a on division of invoice to data sales order. Yeah. Up until now it was like a forward facing only moving from sales order to invoices. Yeah. But coming back coming back from invoicing to sales or Yeah. It's something that we would have to further. Okay. So we have a sub task for this user story too.

00:52:56

Method Junction: Okay. And then um we have success metrics. Uh these would have to be queries. We have SQL. Uh but also have a ticket for amplitude to track some uh key interactions on the stock screens on button clicks. And yeah, that's about everything. So action item for me is I'll add all the user stories AC to each of the respective highle workflows. um update them from apps to user stories um so there's no confusion there um for me I just create technical stories smaller stories based on yeah inside those tickets itself so that it's like only only if you need to like we're trying to identify stuff that we want to ship by itself versus you can break things down into really really tiny finite

pieces but it's doesn't make sense because we're because it's not really testable as we ship it to production. So since we're moving to this sort of we're more flexible um we're just trying to identify high level tasks um high level requirements and I wouldn't go too deep and there's one one PC or sorry one spike investigation or or book same color so that one would have to be we prioritized I guess and came in to stop us from starting the sprint.

00:54:28

Method Junction: Yeah, but shouldn't stop us from grooming this week once we have all the stuff to put it into much more fine fine detail from perspective. I think there was one that yeah to look into the uh non-inouring service items and how how we should invoice it. Yeah, invoice. Yeah, I'll look into that. Should we complete the status of the invoicing status of the sales order itself or purchase order itself? Yeah. And if sure then how should the validation work? Yeah, our concern. As far as the current sprint, um how are we looking? Uh what's left? I think there's a couple defects. Yeah, couple defects. Um the full validation which we're working on. Yeah. and the just like the SQL. Yeah. Yeah. And I think you also mentioned you're looking into the duplication thing with the uh default location. Yes, that's another area. Yeah. Uh where duplication is happening for defaultation. I'd have to look into that a bit more.

00:55:43

Method Junction: Yeah. Sorry. Okay. I was going to ask about the duplication post. Yes sir. Do we have them in? Yeah, we do have them in. It's just two user stories. Okay. They should they should exist how we use use them today. Nothing should change. Transaction completion. Did you investigate the uh thing you said you were going to investigate last week regarding um going back time and changing stuff dealing with purch orders and sales orders where you didn't want it to affect account quantity on hand rules? Yeah. Yeah. Yeah. So I have a meeting with Ben. We're gonna talk about that today. Okay, cool. Yeah. I He's been pretty busy so I haven't had a chance to discuss with him on that. So once I get his feedback then we can do it for you with the direction if he's okay with just shipping with turning on and off we can do that. If not then we might have to do an inventory start date approach there. Yeah. Can you um based off these the response on Gemini post the to-dos? I can do that. Awesome. Pretty good. I think we

uh did pretty well for our first uh backlog planning high level uh sprint funding meeting. This was really well format. So, good job, John. Um come on, Barbara. Anything from you guys?
Barbara Stevenson: No, nothing for my ends fix.
Method Junction: All right, cool. All right, thanks team. See you later. See you.
