Multi-Location Management Live Demo

Invited Charvi Anand Zachary Cutler John Miranda Ryan Karaba Ashur Shamon Barbara Stevenson methodjunction@gmail.com

Attachments Multi-Location Management Live Demo

Meeting records Transcript

Summary

John Miranda presented a live demo of Phase One of inventory management, detailing features like "adjusted stock," "manage locations," new item creation, and the stock adjustments flow, clarifying that the initial release targets internal testing among M11 and M18 accounts. Barbara presented the sales order prototype, which introduced linear fulfillment tracking, including "Items Not Delivered" and "Items Delivered" tables, leading to major discussion points about potential user confusion due to the dual grid structure, and the need for more contextual information and reporting on fulfillment. Attendees provided substantial feedback on the UI placement of the inventory feature, the field usage, the handling of item quantity decimals, and strongly advised against a general customer release of Phase One due to the lack of Phase Two automation, validation, and potential for high user friction.

Details

- **Phase One Demo of Inventory Management** John Miranda welcomed attendees and outlined the meeting agenda, which included a live demo of Phase One of inventory management, a prototype of Phase Two, and a discussion on the

acceptability of releasing Phase One to customers with its current limitations. The live demo focused on the item list screen, showing that new inventory UI features like "adjusted stock" and "manage locations" are accessed via a toggle in account settings under display settings, which is initially disabled (00:01:56) (00:08:27).

- **New Item Creation and Location Management** John Miranda demonstrated the process for creating a new item with the updated UI, which includes new inventory form fields such as a non-editable "Total Quantity in Stock" field, equal to the sum of quantities across linked active locations (00:02:56). Users can assign stock quantities to existing active locations or create new locations via a modal directly from the item creation screen (00:03:53).
- **Stock Adjustments Flow** John Miranda explained that to update the non-editable "Quantity in Stock," users must perform a stock adjustment using the "Adjust Stock" button (00:04:52). This process involves providing a reason, selecting a location, and entering the quantity change. The system automatically updates the quantity on hand and the total quantity in stock upon saving. Users can also link new locations through the stock adjustment modal, which automatically adds the location to the item's linked locations (00:05:44).
- **Location Management and Audit Log** The adjusted stock tab provides a log of all adjustments, showing the item, location, adjusted quantity, and reason, which serves as an audit trail. Users can manage all active locations via the "Manage Locations" tab, allowing them to view, update, or create new locations (00:06:38). John Miranda clarified that Phase One is not yet launched to customers, but is planned for internal testing among M11 and M18 accounts (00:07:33).
- **Future Automation in Phase Two and Sync Strategy** The discussion confirmed that Phase One requires manual stock adjustments, but Phase Two will introduce automation (00:08:27). John Miranda addressed the sync strategy, stating that the "Quantity in Stock" in Method is separate from the QBO "Quantity on Hand" (00:14:19). John Miranda explained that Method's stock is impacted by sales orders and purchase orders fulfillment, while QBO's stock is impacted by invoices and sales receipts (00:15:14). This separation is intended to establish Method as the source of truth for inventory and QBO for accounting only, to avoid sync conflicts (00:16:04).
- **Feedback on UI Placement and Field Usage** An attendee suggested placing the inventory feature access in the preferences screen alongside other added

features instead of the display settings, as the current location felt awkward and was driven by tech rather than product workflow (00:09:15). Another point of feedback concerned the "Preferred Vendor" field, noting that some users use this for vendor leads, which upon syncing, converts the lead into a vendor in QuickBooks (00:11:18).

- **Feedback on Item Quantity Fields and Location Management** John Miranda addressed the use of decimals for the quantity in stock, clarifying it was due to component reuse from existing numeric fields in Method, such as those used on invoices, despite most users likely expecting whole numbers for counting items like apples (00:12:20). Feedback was given to include the ability to manage location status (e.g., making one inactive) directly on the item screen, not just the separate list screen, to reduce friction for users dealing with large lists of locations (00:13:18).
- **Advanced Item Table View** John Miranda showed the prototype screen with the new item table view, featuring columns for "Quantity on Hand QBO," "Quantity in Stock Method," "Available," "Expected," and "Committed." A banner provides a link to the help center to educate users on these terms (00:22:27).
- **Sales Orders and Fulfillment Flow** Barbara presented the sales order prototype, highlighting the addition of "invoice" and "order status" columns for tracking linear fulfillment. She explained the ability to partially or fully deliver and invoice items (00:23:31). The updated item table within a sales order allows users to select items from multiple locations and automatically populates the available quantity (00:24:20).
- **Items Delivered and Items Not Delivered Tables** Barbara demonstrated the division of the sales order into two tables: "Items Not Delivered" (editable) and "Items Delivered" (a log of fulfilled quantities) (00:25:09) (00:26:40). When an item is delivered, the "Quantity in Stock" decreases, and the quantity is recorded in the delivered table. Items that have been invoiced cannot be undone (00:25:09) (00:27:31).
- **Sales Order Fulfillment UI Concerns** A major point of discussion involved the display of "Items Delivered" and "Items Not Delivered" in separate grids, which was noted as potentially confusing for users attempting to view the total original sales order quantity and track fulfillment progress (00:27:31) (00:29:42). Attendees suggested adding a column to the "Items Delivered" table to show the

original ordered quantity (e.g., "6 of 12") to provide context for the delivered amount (00:29:42) (00:31:14).

- **Request for Fulfillment Reporting and Search Functionality** The need for a report or logistical information to show what is not yet delivered, what needs to be delivered, and what has been delivered was raised (00:31:53). The team confirmed they plan to introduce "items shipped" further down the line for a more granular process (00:32:38). A request was made to include search functionality on the "Items Delivered" grid to help users filter through numerous lines (00:44:13).
- **Item Selection and Location Limitations in Sales Orders** The team discussed the need for users to select items from multiple locations via a "view all" modal because limitations in the existing editable grid component prevented filtering within the source location dropdown (00:33:28). Concerns were raised about managing large sales orders (50+ lines) where multiple deliveries of the same item from the same location could lead to scrolling and difficulty comparing lines across the "Items Delivered" and "Items Not Delivered" grids (00:35:20) (00:37:16).
- **Nomenclature and Clarity of "Delivered"** Attendees questioned the meaning of "delivered" in Method, as the term is unique to this new flow and traditionally fulfillment aligns with invoicing or being truly shipped (00:40:52). The "Items Delivered" section was suggested to be a log of what was sent to the warehouse, while the "Items Not Delivered" should function as a snapshot of the remaining quantity needed for fulfillment (00:44:13) (00:46:00).
- **Invoicing and Purchase Order Flow** John Miranda clarified the delivery and invoicing relationship, stating that users must first deliver items before they can invoice those specific lines (00:47:52). Users can create a purchase order from a sales order for the "items not delivered" quantities, and the system allows ordering more than the needed amount (00:48:39). Receiving stock via purchase orders is done through a similar fulfillment flow as sales orders, and any additional received stock beyond the PO amount requires a stock adjustment (00:52:16).
- **Go-to-Market Strategy for Phase One** The question of releasing Phase One to customers was revisited (00:54:34). Attendees expressed concerns that without Phase Two automation and validation, users would face significant friction, including manually updating stock, dealing with potential validation issues (e.g.,

same name/address locations), and lack of committed/expected quantity visibility on sales orders (00:55:31). It was strongly advised against marketing Phase One to the target ICPs, as the manual effort and lack of integration with core workflows could lead to dissatisfaction and requests for heavy customization (00:56:21) (00:59:03).

- **Scope of Inventory and Sales Transactions** The team confirmed that Phase One is only for QBO accounts, not QBDT (00:19:17). They acknowledged the need to investigate how other sales transactions, such as sales receipts and work orders, should interact with the inventory fulfillment flow (00:59:03).
- **Advanced Inventory Functionality and User Needs** Method Junction discussed improvements for the inventory view, suggesting the addition of a search bar and visibility of the previous order total, which was noted as a significant pain point. They emphasized the need to show quantity in stock via QBDT, as this is currently how users operate within Method, recognizing the distinction between invoiced quantity and fulfilled or delivered quantity (01:00:44). The discussion moved towards tailoring views for different users, particularly warehouse versus CRM/back-office users, suggesting that items delivered or received make sense for warehouse users, while back-office users might only need to see the original sales order (01:01:41).
- **Quantity Tracking and Invoicing Logic** Method Junction suggested including order quantity and received quantity in the view, noting that the invoiced quantity is within the delivered portion, assuming everything is always invoiced. They clarified that partial invoicing is not supported in the current flow, where one can choose which items to invoice but must invoice the full quantity of the selected item, and a "yes/no" column indicates if an item has been invoiced (01:02:30). The "undo" button allows selecting and undoing only what has not been invoiced or billed (01:03:33).
- **Interface Improvements and Feedback** Method Junction noted plans to make the interface size bigger. John Miranda provided feedback, expressing that the current state was not bad and specifically requested changing the displayed "amount" to "original amount" (01:04:23).

Suggested next steps

- [ ] John Miranda will reevaluate the placement of the location management toggle from the display settings to the preference screen.
- [ ] John Miranda will consider adding a general manage button for adding and editing existing locations on the item screen.
- [ ] John Miranda will investigate adding a column to the items delivered table to indicate the initial ordered quantity.
- [ ] John Miranda will investigate the need to add a report for logistical information like items not yet delivered, what needs to be delivered by when, and what has already been delivered.
- [ ] John Miranda will consider making the items delivered grid a collapsible log and changing its name to something like 'items fulfilled by warehouse'.
- [ ] John Miranda will investigate the flow for sales receipts, work orders, and other transactions impacting inventory, to decide whether to implement automatic deduction or a shipment creation process.
- [ ] John Miranda will work on low stock workflow.
- [ ] John Miranda will change the original amount to the original.

Multi-Location Management Live Demo - Transcript

00:00:00

Method Junction: Yeah, sure. Hello everyone.
John Miranda: How are you? Good, man. How are you? Very good. Nice to see you. Yeah, you as well. Wow. It's been so long. No, no, it's Barbara's. Wait. Yeah, we're waiting for her. Yeah. Yeah. She'll be here in a minute. Hey guys, coming. Do we need a laptop? Uh, no. No. Just need your attention. Yeah, I just got to watch. Sure. Be back. Basically. No, it's okay. I'll stand next to John and breathe over his shoulder. It's no pressure, man. Oh, man. Hi. What's up? Hi. Kiss us. No. Go sit. No. No. Go sit. Yes. I want to be in the corner. I'm used to this from my childhood. The corner. You know, every every classroom in the corner.

00:01:56

John Miranda: What do I do this time? I think we've all been there. We're all there. Cool. Um yeah, thanks guys for showing out. Um basically what we want to show you is the live demo of what we buil built for phase one of inventory management. And then after that we're going to show you a prototype of what's coming in phase two for inventory. And then we're going to show you if we were to release phase one today to customers with the limitations and workarounds is that accept acceptable like from PS like what do you guys think? We just want to hear your feedback. Great. Okay. So we can start with uh the live demo. So this is a method. This is the item list screen. Everything you're already familiar with. Uh for inventory management when we do ship this to customers in order in order for them to actually see the new inventory UI um they have to go to the account settings. If they're an admin, they can access access the display settings and then they can see this new location management toggle.

00:02:56

John Miranda: Right now it's disabled. That's why you can't see anything. Once you click enable, you click save all changes. Um toast comes up, display settings saved. Um let's just go back to the item screen. Just got to refresh it for now. And then you can see like some of the new elements that are coming. So we have an adjusted stock um tab and we have a manage locations tab. Um this is the same items table but this will be changed and it will include uh quantity in stock in method QBO quantity on hand uh committed expected available stock tracking columns. Um so let's say you want to create a new item. You click create new item. You go to inventory part and then you're presented with this new UI screen. So it's basically all the same input fields but now with inventory form fields. So for example we have a total quantity and stock field. This is a non-editable field. It's uh equal to the sum of all quantities across linked active locations.

00:03:53

John Miranda: So when you scroll down, you see a new section for locations where it's just a editable grid. A user can choose all the active locations that the company has that they've created and they can also assign a quantity in stock to that location for the specific item. So let's say uh what item do you guys want to make? Apples. Apples. Okay. So let's say apples, right? That's the item name. We'll just input these regular required uh fields. And then let's say um 20 apples come takes five. How many does that count? But yeah, let's say we want to assign location 51 uh to this uh uh for this item, right? So we let's say we have 100 apples in location 51. We can add more locations that you have this apple in. Let's say location 10. Let's say we have uh 50. And then if you want to create a new location that you don't currently have, you just click this button. Opens up modal.

00:04:52

John Miranda: Let's say we just want to do location um 30. And then these are just the address fields. I'm just writing whatever in here for now. Yeah. Click save and close. And then when we go back and add an existing location, if you scroll all the way down, uh just give it a second. Location 30 populates. And now you can actually add a quantity.

Let's say we have 200 here. Okay, 2,00. So now let's click save. And depending on if all the required fields are there, it saves successfully. And then you can see your total quantity in stock updates to reflect the sum of all linked um locations and the quantity in stock in those locations. So now let's say oh um how do I actually go and update these quantity and stocks? Because this is a non-editable field now, right? Um you would have to go in and do a stock adjustment. So there's a button at the top right corner adjust stock.

00:05:44

John Miranda: When it opens up a modal, you can provide a reason. So it could be anything. Let's say uh got a new shipment of apples. And then you can choose your location. It can be an existing location you already have or it can be even a new location. So let's say it was an existing location, which I think I did location 10. You can see quantity on hand populates with the existing stock in that location. Let's say you want to update that to you want to add 100. So you just click 100, save and close. This screen refreshes to show that uh location 10 updated with 100. So it was 50, now it's 150. Uh total quantity stock also updates. So you can also link new locations here as well by just adding linking a new location. So let's do loc I don't know 231. Uh whatever reason you can see quantity in hand here is nothing because there's no stock in this location. Let's say we have a thousand here. Save and close.

00:06:38

John Miranda: And you can see 231 automatically links. You can see the quantity in stock. You can see the total quantity in stock updates as well. So that's basically that specific flow. And when a user wants to see the adjusted stock or see the log of it, they can go to this tab here and they can actually see uh I'm sorry this is not correct. Yeah, they can see the log of okay um the apples location 10 quantity adjusted with 100 and the reason why just to keep their own audit of uh what happened in each location and what forever reason, right? And let's say the user wants to manage their locations, they can click this button here, which leads to this new uh location screen. Gives a list of all the active locations um that the user can view. And if they want to go update a specific one, let's say location 81, you can click into it. You can change the name, say location um 20,000, right? Uh you can update the address as well.

00:07:33

John Miranda: Everything saves save and back. You can also create a new location here. Updates this table. And we can go back to that apples. Let's just change apples. Oh, that's adjustment one. Sorry. Let's go here. And if we go down to the link locations. Um, okay. Sorry. It should update here. I guess I didn't have a location that I previously updated that was already linked, but it would update here. Um, but yeah. So, that's basically the flow for what we built so far. So, you can uh create and edit new locations. You can uh assign a location to an item. You can create stock adjustments and um yeah, that's basically phase one of what we built. Uh this is not launched to any customers yet. It's just internal folks right now. It's not actually it's not launched yet. We're still in the release deployment process right now, but we're only planning on releasing this to internal people, so M11 and M18 accounts to try this out and test it out.

00:08:27

John Miranda: Um but yeah, any feedback, any questions, concerns? We always just have to manually adjust the stuff like what happens within it forces. Exactly. So that's where phase two comes. Everything's going to be automated. Uh the entire process will be controlled and that's what Barbara's actually going to show you with the prototype. Got it. Yeah. But this is just phase one. So this is literally just like location management like creating assigning. So the question that you posed in the beginning is this something that we can show the customers yes but also no because we can show them the possibility but it's not usable. It's it's not it's it's disconnected but you'll see what's coming and then you can see the big picture of what we're trying to build. So um I'll stop sharing. You can share. Exciting though. Very exciting. Yeah. I got a couple things for you though. Yeah. What's up? Yeah. We'll do those first.

00:09:15

John Miranda: Yeah. Um all right. So the first thing uh just that I came to mind is getting the advanced inventory. Okay. So uh go to your dashboard, right? Okay. Let's go to dashboard. Yeah. Yeah. And go to estimate preferences. Okay. Uh estimates. So right

now with a lot of these features like estimate approvals, opportunity reorders, all these new things you can get addition to within the app, we usually have that set up in the preferences. Mh. If you go into approvals, okay, you can turn approvals on. I can turn approvals on, right? So, I just thought it was a little awkward that all these added features are in the preferences screen, but then this feature for items is kind of in a different area. So, I would kind of expect for it to be in a preference screen. Okay. Also, like multilocation, seeing that on the account settings page, does that mean multi-entity? Like to me as a user, what does that mean?

00:10:15

John Miranda: Right. Right. Even though multi entity is different, we know it's different. The client know it's different. They're in the same screen. Yeah. Yeah. That that that's fair. Um originally, uh we chose to do in the display settings. Um we got the direction of our tech lead. So I think that was like the easiest place to put it. So we went with that approach, but we'll take that feedback and we can definitely reevaluate the placement of it. Right. Um for just quick estimate preferences, only admins can actually access and change anything here. No. No. Anyone? Anyone that has access to Oh, this app, right? to to I think edit permissions access and manage permissions manage manage okay cool gotcha okay so we've got the same thing as well like if you went into opportunities preferences the reorders and stuff so all of them have that in the preferences okay um go back into your yeah and like tech shouldn't make this make this call you know what I mean technally knows knows development tech doesn't know workflows and CRM usage okay in my opinion it should be product driven versus tech driven.

00:11:18

John Miranda: That's fair. Thanks for the feedback. But uh yeah, open up uh our apples. Apples. Okay. Okay. And scroll down a little bit to preferred vendor. Yeah. So preferred vendor is that just vendors or also vendor leads? Um this is is is this not a stock field? It is a stock. It is a stock, right? Yeah, we're just using the same. So, it's probably just vendors. It's just vendors. Yeah, we haven't changed any of the functionality with um sales information, purchase information, asset accounts, everything's the same. So, just so you guys know what most people do with that, sometimes they do want vendor leads available. Yeah. But if you have vendor leads available and this item then syncs to

QuickBooks with that vendor lead, it'll convert the lead into a vendor. Ah, okay. So, I'm not sure if you guys discuss much in behind that field and how people use it. I see it just for vendors.

00:12:20

John Miranda: I see people say do it for vendor leads as well. Uh, but when our reps bring in vendor leads, a lot of times even our reps go, why is all my leads turning into vendors? And that's because you synced that item, converts the lead into a vendor, that's why they're now a vendor. I see. Okay. Okay. Um, with the quantity in stock. Yeah. Are you guys is there a reason why it's a decimal? Uh, I think that's just ethical component. Yeah. I think also it's decimals today for items like quantity on hand. A lot of numeric fields use a decimal field instead of an integer field, but how I feel most people will be using this is I only have one apple. Yeah. I don't have one and a half apples. Yeah. Uh so just wondering if there's a design reasoning behind decimals or not, but uh that's what most people use as a whole number. Yeah, for sure.

00:13:18

John Miranda: No, it's not design. It's more what we have with our components input fields today. Cool. So it was just reused essentially. Yeah, I think all the quantities like that sit on invoices I guess primarily just invoices is like a decimal. So if you are taking away zero and a half, it needs to be a decimal because if you measure it has to be Yep. Uh and then in regards to the location management Yeah. uh as a as something that uh I could probably hear from our customers is them to also be able to manage this on this screen as well. Not just adding a location, but also maybe saying a location's inactive because what a lot of people do is when they come in here, like what you saw with your list, I got a big old list. And so customers when they go or a user goes in and they look, they're like, man, this is way too much. I got to remove some of this. Right? So they like to do it in the moment of usage.

00:14:19

John Miranda: I think there might be some friction of leaving the screens coming to the

list screen doing another click to another screen to then make it inactive. Uh so with with the add what I can see being requested is making that like as a general manage button to then go and add and edit existing locations. Okay, that makes sense. That's a good feedback. Yeah. And then my last question is this mobile friendly? Yeah. Yeah, it is. Those are the things on the top of my mind. Okay. Amazing. Cool. Um, one thing I think I didn't mention is this quantity in stock. It's only method only. So, this is not the same as QBO quantity on hand. So, two separate uh quantity fields. Interesting. Yeah. So, if they're using this, they essentially shouldn't care about quantity on hand and QuickBooks. They're basically working with this. Yeah. They're working with inventory stock. Uh, QBO is accounting stock.

00:15:14

John Miranda: So, that impacted from invoices, sales receipts, etc., But uh quantity in stock and method is only sales orders and purchase orders would impact this based on fulfillment like if you're delivering it in a sales order or you're receiving it in a purchase order. And we'll we'll show the flow. Yeah. So you're saying it's always going to be two different numbers. Um if they follow the fulfillment uh flow that we've outlined, they should be aligned, but there might be a possibility that the user creates an invoice separately. Yeah. and that will impact their QBO quantity on hand which is acceptable. If they want to change that they can just create a sales order follow the fulfillment process to update it or they would have to create a stock adjustment. Why? Why? Yeah. That's so different than how it works today. We're creating obstacles now. Why? Because today how it works is it doesn't matter if you use QuickBooks or third party integration or method.

00:16:04

John Miranda: Yeah. The number is always the same. the the problem uh the problem there is we we we can't be uh aligned with QBO just because there would be so many more same conflicts uh if the numbers were the same and we had them syncing together just who told you that that's from our investigation that's false how would us receiving numbers from QuickBooks causing sync comments just because um if you're creating like that's not how it works that's why I'm saying that no but like inventory management works this way, right? It's not through accounting purposes. It's not

through invoices or sales receipts that impact physical stock. That's accounting stock that gets like sales orders are never fulfilled fully fulfilled. No, that's fine. What's wrong with that? I mean, so would you then consider like canceling a sales order and then going putting back? You can do that. We'll be able to do that. Okay. Yeah. We want to because the the main reason why is we want method to be the source of truth for inventory and QBO to be accounting per only.

00:17:11

John Miranda: We want to create a clear divide between who owns what so that we're not in the those weird middle ground but okay QBO is showing this one thing. Why is it not updating here? We want to provide clear separation between the two. Can I ask a question? Yeah, of course. Um, just to to play devil's advocate. Yeah. And not to say any of these decisions are wrong in any way, but like it makes sense. I get it. Yeah. To play devil's advocate. Is there any other feature that we currently synchronize with QuickBooks where we we are never aligned with QuickBooks on? No, I don't think so. So now we're introducing one. That's that's fair. It's it's serving a different purpose though. 100%. Yeah. But now we're we we already the way that it's marketed on the website, the way that everything but the problem is it you're measuring two different things. We can't have we can't have an invoice creating QBO impact our quantity in stock because that's not how we absolutely can.

00:18:06

John Miranda: We can't though. It's not it's not it's not it's not in we do it literally. I mean, if if that's what the customer wants, it's uh we can there there's a way to do I know I know but I understand your point of view too that we could do that but there's there's a truth factor here and we we want to create a clear source of truth here. So that was that was the main the main decision is this kind of it replaces QuickBooks. So the total quantity in stock is essentially quantity on sales order. No or quantity on PO like what is this then? So this is literally the amount of stock you have in a location like it's literally everything. What what barber available that is not available everything you know it's just everything what available will be is a calculation of your quantity in stock minus your committed plus your expected which will barber will show you yeah exactly and we'll have a whole screen so like what I mentioned on the item screen you're going to see like

four more new fields available committed expected quantity in stock method quantity on hand QBO so the user can see okay uh everything the entire picture really really phase one.

00:19:17

John Miranda: Okay. Exactly. Yeah. Yeah. This is phase one. You plan to also be four QBDT accounts. No, just QBO accounts. Got it. Yeah. Got it. Yeah. And and and that's fine. Why do we choose to go that approach? Uh QBDT already has advanced inventory. Uh the majority of users who are requesting inventory management was from QBO accounts. So we're designing it for them. And then let's say we want to bring QBD2 customers over to method to do more fulfillment stuff inside of method because we want them using packs and paying us for SAS subscriptions. We can expand this to them because even today I don't think there would be a problem. Yeah, there shouldn't be a problem with that. It's just method stock only really. Oh yeah. I don't know. They hate that it doesn't sync with method the way they want it to. That's what they do.

00:20:02

John Miranda: And being able to edit it the way they want to edit. Oh, we can we can make it more malleable. Like the way that this is like we can do stuff like this. However you want it to work, we'll make it work. Okay. People get really frustrated. Really? I didn't know that. Like the main thing in QBD that really gets people ticked off your whole location thing is so flexible here. Yeah. In QuickBooks Desktop, you want apples now to be in location two. Can't edit it. And guess who? They blink method. And we go, "No, it's not us." That's how QuickBooks works. And you go look at QuickBooks help center articles. Why can't I change the location? They got to create a whole new item. Just to say I'm in a location two even though apples are at location one. I want it now at location two. Make a new item.

00:20:46

John Miranda: That's so bad. Yes. Wow. So there's a lot of headaches desktop. Interesting. And what you're showing is oh you want to change location. They would

love it. Interesting. Yeah. Keep that in mind that there's a demand. You have to also understand in QBT when they're sending their fulfillment process inside of QBT, it's hard to get them into method to fill to do the full fulfillment process like estimate, sales order, invoice, PO, bill, all of it. And here's the here's the positive side of it. With method, we can do all of it and sync it all to QuickBooks so it all ties together. With QBO, we cannot tie it together yet. That's the problem. In QuickBooks, you can tie it all together. You can just say that this estimate is for this invoice, this PO is for this bill, etc. We can do that with QDT today, but not with QBO today. Gotcha. So, if we do have that ability to unlock that down the line, sync possibilities, we should definitely explore that.

00:21:40

John Miranda: From a sync perspective, okay? Yes, method should control it, but it should still even though it's the source of truth, it should still tell QuickBooks this is the the true number. You know, I wouldn't be afraid of sync conflicts because like the sync conflicts to me is not an issue because we can we have access to different tables to do it like inventory adjustment table that adjustment that you showed. Quick is called inventory adjustment. We do the same thing and we can tell do it. Do you know what I mean? So we have our own ways to work through it. Okay. If if you're worried about complex Okay. Do you know what I mean? Yeah. Appreciate it. Cool. Cool. Just as like a side note is there like the item inventory screen you guys updated the design aspects of it. Yeah. Um, is there plans with your team to update like the non-inventory items and stuff? Of course, this adjustment would have been there, but like now everything looks different.

00:22:27

John Miranda: Everything we we didn't plan for that. No, for now. No, only inventory for a bit because it's a different team that owns that as a whole, right?
Method Junction: Actually, eventually.
John Miranda: Is it your team? We own it. We own it. Yeah, we own it. We own it. All right. Okay. Oh my god. Um, can you see my screen? Yes. Okay. So per what he talked about on the table we can now see quanty on hand QBO quy in stock method available expected and committed and just I we all know the language of what this means but in case for the first couple of days we have this banner here telling you get full visibility etc

learn what they mean so we're going to redirect them to the help center where they could you know educate themselves accordingly so that's essentially the only thing he didn't demo you know for that so now I'm going to go to sales orders Um so one second real quick.

00:23:31

John Miranda: All right so for sales orders what do we have now? So previously we just had um date created order customer amount but now we have the invoice and order status as well. So that's why we're like it's a linear fulfillment process. You could invoice from your sales orders like we do today. Um however now you could you could fully deliver an item. You could partially deliver an item. And I'm going to show you what that's about. Or you could put fully invoice and partially invoice as well like we do today. So let's say we have um an open sales order. You've created it for whatever reason you want. Let's say you want to come back. So we click on this and we have sales order, right? So everything top here is what's already there today. So the addition and what's new is updates to the items table. So what's the update? Right? So you come to your items table today. You can see your inventory and non-inventory items.

00:24:20

John Miranda: Right? However, let's say you select an inventory item which is the hair wax. And now we can do multiple locations. So you want to see the multiple locations that the hair wax is tied to. So you click on view all. And you can see we have 232 items in here, here, here, right? And then you say okay. And then you can now select from the source location because you've seen it how many you want. So now this is the full prototype. But let's assume you clicked on the junction. What happens is the available quantity is now automatically populated and you can enter your quantity to sell rate amount etc whatever we want today. So now what's the addition here? You could choose to deliver your items partially or fully. So in this prototype I'm just going to explore hair wax. You have 12 to sell and you want to sell say six of those 12 items. Right? So we come here you deliver partially.

00:25:09

John Miranda: We tell you to choose um items to deliver. The point can't exceed available stock. We have guards in place if you do ignorance and do whatever you want. So let's say here you want to do six, right? So you do six and you save. We tell you it's been completed and then you come here. So now what's new here? We now have two tables. We have the items not delivered and the items delivered. So for the items not delivered, that's editable. You could come and add 11 more hair waxes. You could come and add more items. You could do whatever you want. But for the items delivered, what you see here is we have the hair wax source location. you delivered six on October 6th and the rate. So now what you see is has this been invoiced or not? And there's certain rules that follow invoicing. You can't undo something that's been in an item that's been invoiceed, etc. So let's say um let's assume what I'm just going to do is show you what the invoice looks like here.

00:25:59

John Miranda: I'm going to have to go to my screen because that's not prototyped. But where we know where the create is, right? So we click on create and you want to create an invoice. So real quick, I'm going to take you to the invoice inventory behavior. All right. So, what happens here from the sales order? You say you want to invoice. Let's assume. Now, I'm going to show you something more complex, right? That was three items. So, let's assume you have that was one item. Now, we have three items here. And the first two items here are not invoiced. Right? I'm just going to zoom in a little bit. The first two items are not invoiced. By the time I click on create invoice, it takes me to this page. And what do I see? I see the items that have not been invoiced here. And I say I want to um invoice hair wax and hair comb.

00:26:40

John Miranda: By the time you click save, it redirects you to the invoice page and then you know you could do whatever you want, adjust and save, right? So um that's essentially the flow. So that's what we mean by following that linear process creating a sales order so that we're able to like sync your method and we make sure that's very easy you know do it from there come here and that's what we have coming and again

like the guards I mentioned. So, do we have any, you know, questions or comments about the sales order and invoice fulfillment flow? Just that first piece that you showed us, the first the delivered area, items delivered, items not delivered. All right, give me a second. Let me go back. Sure. And then really just the question is um for an item delivered, that one was set from that quick little modal that you that you showed us. Yes. But you can't undeliver it, right? You can you can un So you can't und deliver.

00:27:31

John Miranda: Sorry, my mistake. So you you mentioned invoice. If you invoice it, you can't uninvoice it. It's already been delivered and paid. Exactly. Yeah. Yeah. Yeah. Yeah. Got it. Okay. So for the items delivered piece here, um what does this really mean for a user? What does this impact? So what delivered means is that originally in your items not delivered, you have quantity sell. So you committed six hair waxes for this customer, right? When you go and click items delivered, follow the fulfillment process and click save, you're saying that, okay, these six quantities have been released and they've been like shipped or they've been delivered to the customer. They've actually exited your location and your warehouse. So your quantity in stock actually decreases by that committed amount. So that's what that's what this represents here. So the reason I'm asking is because it's like on two completely different visible grids. Yeah. where I don't see myself from a high level what was the original sales order for right I see what was delivered and what has not been delivered yeah in totality that is what the whole sales order should have been for originally but that can change right yes so so imagine I have and basically what I'm trying to figure out now is when do I look at items not delivered when do I look at items deliver as

00:28:45

John Miranda: a user like I know what you guys are saying but as a user for I don't know method I don't know all this Mhm. When do I look at each one and then how do I validate it? How do I know that's correct? Where do I figure that out? Um, so like he mentioned, if you have items delivered, it's impacted, right? So you go back to your table and then you see that it has reduced by five, six, whatever it is that you put in. So expected would still expected would go down. Yes. Would go back up by to or whatever would change. Yeah. Exactly. It would have been like expected 12 now expected six.

Yes. But um available less something like also what you're looking for is a original ordered quantity original like the original sales rate in and of itself when I clicked print and I emailed it to them. What was that? Right. So the original So you're saying in the items delivered table you want to know how many of how many?

00:29:42

John Miranda: Correct. essentially it should show 12 as the ordered quantity out of which six has been like another initial ordered quantity I guess is what you mean. Okay. So this is how um sales orders work. I believe when you invoice sales order items there's a little seps invoiced and it gives you a number. So what was the quantity on the sales order? How much was invoiced? Just a separate column. So that's how it works today. So now we're changing that a little bit and saying like now it's a completely different grid. Now the numbers are skewed between the grids to form the total. So that's where I'm as a user I'm kind of thrown off a little bit by that. Might not be a big deal for true fulfillment companies, but for anyone trying to look at the total sales in of itself. I'm clicking print. Does it still look the same now? If I click print or no, do you know what I mean?

00:30:31

John Miranda: And if I go to the portal, do I see two different grids on the portal? Do you know what I mean? Like what it's changing a little bit, which is fine. How do I make sense of it as a user? How do I make sense of it as a client looking at it? That makes sense. So I guess the reason behind this was um your items not delivered could be adjusted 100 120 times. So this was to become 500 it become this. So we're like okay let's just focus on the quantity delivered. However it makes sense to say at this date it was 12 of six of 12. The next day it could be 6 or 25. However you did make that change. So does that make sense for tracking? I think making a change might make sense. Yes. Depends on the industry. Imagine for backorded items, you know, like, hey, I wanted a hundred of these, you know, apples. Sorry, we're out of Gala.

00:31:14

John Miranda: We only have Macintosh. Okay, how much of Gala do you have? Oh, I only have 10. Give me the 10. Give me 90 other Macintosh. Okay. Do you know what I mean? So like back order things. Forget it. Forget about the 100. Give me the 10 instead. Um, so I just want to see that. You might want to change that a little bit. Okay, we'll consider that. I don't I don't know how deep we have to go there to be honest. You probably don't have to go that deep for something. It's more surface level here. The numbers really all is all that matters. Yeah. Yeah. I think for this it will be softer level. It will be more as that when you order six what was it? What was that? 12 six of watt. Yeah. Essentially 25 of what? Yeah. So yeah, I think that's that's the one addition we'll be able to make surface level here that wouldn't necessarily impact our dev time.

00:31:53

John Miranda: Maybe that's something we can put in the items delivered table like the items table. Yeah. Yeah. Or something investigate. But another column here that just lets you know of what like what percentage of what did you order essentially. Yeah. Okay. And then from the fulfillment piece, sorry Trevor, from the fulfillment piece, if we're telling them they got to use method to fulfill this item delivered is B or or items, do we have an items to be delivered? I know it's not delivered. Is there like a report I can print to show them what is not yet delivered? What needs to be delivered by when and what has already been delivered? So it's something to think about. I'm not saying you have to add it here, but we get asked this a lot. I need I need like logistical information, shipping, what has actually gone out from my warehouse. Ask warehouse guys. Yeah, but I use method. Okay, so how do we track that?

00:32:38

John Miranda: Right now, we track based off some of the stock fields plus maybe we'll add custom fields. Give them to anytime something happens at the warehouse, tell them to come into method, put a number here, and press save, you know. Yeah. So, something we have the line is item shipped, which is what you're saying, items delivered and actually deliver. So, our MVP version for now is just those two, but further down the line, we're going to have shipped as well. And you know, we'd have to kill for that. I'm

sorry. Yeah. Yeah. So it be like items not delivered, then items shipped, then items delivered. So it kind of falls a little more detailed process, granular process. It could get it could get too much on one screen. Honestly, that's why they just ask give me a report. Let me just print the report for everything, every item, every sales order. You know, the thing is I think like would going to the items table and seeing like filtering by a specific item and then seeing the committed or expected would some people would live there.

00:33:28

John Miranda: Yeah. I would say majority might not. Okay. Okay. If we teach them, if we train them that's where to see it and to go, they'll use it. We have to train them to do that though. And they have to understand this is where to go to see that information. Whereas here it doesn't tell me where to go to see that information. You know what I mean? Okay. Does that make sense? Yeah. No, that makes sense. The inventory column view all button is it only supposed to show us the location specific quantity? Yes. to that particular so then um I guess my question is why take so much real estate when we could just put that as a column on the source location drop but it's not working our editable grid is limited that was the first thing we did but it's not working so that's why we now had to add this here as well so it's not able it's not working um our we got feedback from the engineering team that we're not going to be able to work our columns that way filtering within the column based on a selection of something else in the column based on selection of something else.

00:34:27

John Miranda: Yeah, we can't now. It can't read you can't make that relationship apparently. I think that's always been the case with that. Yeah, we would have to like redesign the component itself. Exactly. You can't you can't filter inside that grid with something inside that grid that's not yet committed. It's saved. That's the issue because it's not saved on the table level yet. That was the original design actually. We wanted to do everything in source location dropdown, but we couldn't. Yeah, we to be able to do it on runtime without saving grids. Yeah. Doing that apparently would have taken a while. So, we're like, "Okay, what the next?" We have to start working on this. So, this is MVP. Yeah. I got a question for you. Yeah. Uh, all right. So, right now we're working just with one item. Yeah. Customers got 50 items. Yeah. Customers doing multiple delivered on

one item.

00:35:20

John Miranda: Yeah. Yeah. How previously Ash was saying like with having
Method Junction: column so I can directly see what's take getting taken out of that bucket. Yeah, just like right next to it. But as of right now, like I'm thinking of the average person that comes into some into this. I need another item from the junction. Okay, I might not edit the quantity for that line. I might add a brand new line for hairax at the junction. Now down below, I got Herax junction, Herax junction. Which like item is getting fulfilled there in the sales order line. So I've got a six, I got a six, I got a six, but I got like a 12 and a six. Would it matter to them which one was fully received on those items? like how do I know what's coming from what line? And especially when I got sales order lines where I've got 30 sales order lines. Now I've got from each sales order line three deliveries.

00:36:24

Method Junction: Yeah. How am I lining everything up? Because one way that people use what Zach is saying is imagine they have t-shirts. Yeah. All they're choosing is item t-shirt. Doesn't matter which t-shirt it is. If they need descriptions like not the size, the color green, they'll put it
John Miranda: the description, not as a separate type of item. So that's why you might see multiple all at once and like why are they all here? They're all different colors, that's why. But they're all different. And even still, if you have someone that goes, but they might not be and they can they might all be red. They might all be the same. And they also and even with the hair wax, do I know to update the line that I'm already working with that I need five more or am I going to create a brand new line to say I need five more? And so they keep going with that. Now you got six lines kind of for the same thing all from the junction because I've got additional quantities.

00:37:16

John Miranda: How do I compare everything down below that's saying hair wax from

junction comparing it to my lines up above? cuz if you have 50 above and 50 below like man that's a lot of scrolling I'm not going to do this. Exactly. Um, so I think you could, for example, if I get you right, you have you selected like 11 hair t-shirts, right? So you have say 11 and it's all the junction and it's all 12 or 12 15. Um, and then you have items received and then you have like a bunch of stuff here, right? So your question is, how do I differentiate between these two? How how do I know? So I'm I'm saying here I'm ordering X amount out of that line, right? Yes. Out of here. Sorry. Show me again how to say I'm ordering that. So I received that line. Let me see. Let me just go like delivered, right? Yeah. Let me go through the sales flow real quick.

00:38:11

John Miranda: So deliver partially, right? So yeah, you're going to enter. So now what will happen is if you have 50 hair wax items, they're all separate items. So they're all going to appear here separately, right? And then you now select it was 12 in this one and you selected it again for whatever reason again another five2. So you're now going to resolve that here. So partially delivered and you want to do two or five in this junction in primary location. Sure. You want to do six of 12 in another location. Yeah. But we're restricting aren't we restricting them from adding the same location um the same location uh to or they can add like for example hair wax we can add primary location here 20 times. Yeahoud they can do that. They can do that. It's going to be the date it was added the date you decided to do it even if it was the same day but it's going to be separate. So we're not going to merge because it's time to primary location where it's going to be separate as well.

00:39:07

John Miranda: Right? So they could be separate items. They could have unique descriptions or it could be the same item. I just didn't know to update the quantity. Yeah, it could be a brand new one. Yeah, but it doesn't matter at the end of the day. What matters is like are we showing what is there to be shown? Uh to to Barbara's point, like yeah, we probably don't want to amalgamate it all and combine them all. I would agree with that. We probably want to combine them all. Hit cancel here now and you're coming into the just to the sales order screen. And you've got 50 lines up here and you've got 150 lines down there. And I've got all these hair waxes coming from like the same

location for whatever reason why I selected it. How do you figure out what's How do I know what's what and what's all connected and related. Working with one line, it's easy. Working with 50 and then 100 each line delivered four times.

00:40:02

John Miranda: Uh even so you're saying even if we're able to use the s the sort that we have today to sort down to the hair wax you have 50 items and you have 15 hair waxes in a one or list of 100. If I sort by item doesn't that help me narrow my focus a bit. It can but it's you still have to scroll up and down. You still have to scroll up. I would still say like there's nothing. Imagine you're looking at an Excel spreadsheet for a moment. Okay. You have 20 rows above 20 rows below. same information but one extra column on one of them and now you have to scroll up and down to compare that column. Does that make sense? Or do you want that column up above with the original 20? Do you know what I mean? So like from a user perspective that's where we're how they will scan for that information not not to go up and down cuz like the item delivered I know you want to do this fulfillment piece within method.

00:40:52

John Miranda: Method is your fulfillment software as well but we never have been that technically. Yeah, we you we are because you're using methods to track the data, but now we're saying this has now been delivered. But what does that mean? What does that really mean inside of method? What does it mean delivered? Because nowhere else in method do we see delivered that word delivered anywhere else in the CRM? So why are we adding it here if we're not adding it anywhere else to the CRM? Do you know what I mean? Is it in the sales order? It's unique to to this flow. That's what I mean. It's only unique to this specific flow. Mhm. But there's other portions of this whole workflow as a whole where it does make sense to to show someone what's been delivered. But what is delivered actually mean in reality? It should just mean fulfilled truly shipped. That's what it should mean. But it's not.

00:41:39

John Miranda: But that's not how we use it today. People use it as it's been invoiced today. That's how we use it today because that's how you do fulfill. You do fulfill via invoicing. Something shipped, there's an invoice for it. It's not just a packing slip without an invoice. It's a packing step followed by an invoice. So is it the a nomenclature issue? Not necessarily nomenclature but also just like um holistically understanding what does what does this information mean for me as the user? Do I know what's has been truly shipped? Yeah. Or is method telling me this has been shipped but in my warehouse it's still there because someone just clicked a button. Do you know what I mean? Like I know what you're saying. Yeah. But the fulfillment process is a little bit more disconnected. Exactly. At the proponent of that though we can't solve for s***. s***. We can't. No one can.

00:42:23

John Miranda: you you're relying on the warehouse people to do it. So there's always going to be a disconnect. But now we're saying method is the source of truth. But is this true? But it's it's a disconnect. And even when you start talking about work orders, like what if you have a company that delivers these things from a sales order? Now it's already delivered, but we're going to do delivery again. It gets like a little bit confusing, I suppose. Which goes back to your like initial point of everything. Not to like rebuild it all, but I think help us make sense of it makes like I don't know how to sell this to a customer and then I don't want a solution for it to make sense to them. I know how to make sense of it here, but I don't know how to make it sense make it make sense for them because they're not now have to figure out how how to use this every single day. And I don't know if they're going to get sick of it and just say or just tell us customize it, change it completely.

00:43:14

John Miranda: I I just want to remove certain things or just completely change the whole screen. Okay. because of there's a divide here between what is truly fulfilled not not just fulfilled but what is truly being discussed from a sales order what has truly been sent or received which is separate disconnected and then what's been actually invoiced

okay you know what I mean so like the QuickBooks flow is also disconnected from the warehouse world it's just what's been invoiced because you don't really know if it's been sent from the warehouse or not whereas I see that what you're trying to do here is like hey get the warehouse workers to come in here and say it's been shipped that's Hey, I don't think giving making it divided this way is going to be easy for users. It might be easy for some but then harder for others. Whatever be on there, 50 lines, 150 lines down below. The one thing that might help a bit when you guys are thinking about it is the items delivered portion, having the search bar in the advanced search there.

00:44:13

John Miranda: So that way I can look for my hair wax from that location. and get rid of all the other noise that the other 130 lines. Oh, there's my four lines. But then you got to go and scroll down and search again on the bottom grid. You know what I mean? Like why the bottom grid has that search and then to solution that part, but like to build on top of that the items delivered is really just like a log of what was sent to the warehouse for example. And then you need in the items not delivered the initial ordered quantity or the total ordered quantity and then one column to tell us this has been fulfilled and this is the remaining quantity and this one really can just be collapsed. So you open it when you want to see it but that gives you a snapshot of or potentially if you filter or that but like the the items not delivered gives you a snapshot of this is the remaining that we need to deliver because that's all the people in the office care about.

00:45:09

John Miranda: And then this is really just what was sent to warehouse for delivery. They only really look at the items delivered afterwards if there's disputes or discrepancies. Exactly. Hey, we didn't ship 100. Nothing's telling me we did, you know. But um just just to not throw too much at you guys, we're saying a lot about this piece and we're focusing a lot here because this is new. People will need to understand how it works. That's why we're like, let's focus here a little bit. Yeah, for sure. Um, and then the the last thing I wanted to say is like for the whole items. Oh man, I lost my train of thought. Okay, move on. I remember it. Okay, I want you to take what you were talking about again though. Sorry, say that again. I want you to see what you said again. Oh, yeah. So, uh, basically the items not delivered grid should show us a snapshot of what was the initial

ordered quantity.

00:46:00

John Miranda: What's, um, kind of like available. That's fine. what's available, what is now remaining, and what has now been delivered. Yes. So, all four quantities. And then the grid at the bottom, which shows item delivered right now, um, that should really just be collapsed because let's say you have 50 or 100 items, then we don't really need to see this because the grid above gives us the snapshot. The the grid at the bottom is really what is sent to warehouse to fulfill which has the logs as in this was the date it was sent. Yeah. This was the item that we sent to warehouse to deliver on that date. So this is the warehouse logs. The items not delivered is basically giving us a snapshot the whole thing the actual host. how how we were going about the item delivered is um not being what's being sent to the warehouse but what's being actually exited from the warehouse to the customer calculate the stock. Yeah. Yeah.

00:46:59

John Miranda: To the customer whoever. Um because like the flow we designed here was specifically for like our wholesale and distribution customers and like a specific segment uh or ICP. Uh but like I hear your point of view here. Um are they asking for this? Uh this is from research as well as what we looked at how other competitors actually built um inventory management and this is kind of the structured flow. Um another thing is uh but part of the sales order like part of like here's what the sales order exactly. Yeah. Yeah. Part of the sales order. Yeah. Not what the sales order was but now actually just what's not delivered what is delivered from the sales order. That's it. Who cares about holistically what it was on the sales order. Yeah. Basically interesting. Yeah. Like I guess for the delivered, you could always just call it like items fulfilled by warehouse like you know something where we're putting the onus on the warehouse that if they've done their job.

00:47:52

John Miranda: Yeah. Yeah. True. True. True. That's a good point. I remember what I was

going to say now. Yeah. Does invoicing tie into this? Yeah. So, so if I invoice, it's now also item delivered at the same time. So, you can deliver uh without invoicing. Oh, can you invoice without good? Yeah, you can't. No, you can only deliver what? You can only invoice what you deliver. So, so you have to go through the process of say delivery is done and then you can invoice those lines. Yeah, you can't invoice everything right now and then like let me say now everything's delivered. Got it. You can't do that. Got it. Now the other way. Yeah, I need 50 apples. I got 20. Can I PO off of this? Yeah, you can. You can. Um, you I I I designed a flow for this.

00:48:39

John Miranda: I I don't remember exactly how it looks, but you can create a purchase order from a sales order. Uh and but I think it's only for the items not delivered uh quantities in there. So the items delivered won't be what you're selecting uh when you're creating the purchase order. Only items, right? You still have your low stock workflow. Uh low stock is coming. It's coming. It's coming. We don't have yet. Yeah, we don't have that. back. Yeah, but I'm pretty sure with purchasers we could purchase as much more than what we actually defined on the coin. I I I think I we that's how we I think we defined that. Yeah. Cuz it wouldn't make sense to do less than that. And I know I'm going to need 50 more in the future. I'm not getting restricted. Yeah. No, we're not restricting. Yeah, I'm pretty sure we're not. But for sales, we are.

00:49:29

John Miranda: And it's something to think about going through that using that preferred vendor. Yeah, they might want to use a lead because now I do want to order from them because my other vendors I don't have. We do, but nobody uses them. They don't really use it too much. No, I know. Nobody uses vendor leads. My vendor leads. Yeah. Until you need it. I know. You're right. Until the right ICP comes along and I need vendor leads because I've got these three other people I might buy from. I've got these vendors who I do buy from. My vendors now say I can't do that right now, but I need it now. So I might use one of my leads, converts them into a vendor. So that's something to think about going into the PO flow. Okay. Okay. But again, now I'd use that as my preferred vendor, converts them into a vendor, that whole Okay. Did you find when you were doing when you guys were doing research?

00:50:18

John Miranda: Yeah. Was there any pain points around content guys? I'm gonna put you back. No, I know. Was there any discussion around from the ICPS? was there any discussion around um not just the fulfillment and warehouse inventory process but also the sales process. So from a sales perspective if we limit them from what what they're able to choose and specify on a sales order that's not a posting transaction that does not go to QuickBooks for like touching the general ledger ledger or actually touching inventory. If we're restricting them here at this point is that going to stop them from using this? Do we know? That's where we need to start testing it. I don't I think this the how we designed it, it shouldn't prevent them from selling what they can't they don't have because we're allowing them to still sell it. But in order for them to sell it, they let's say the available quantity is like 200, but we put a quantity to sell of let's say 300. We can still save this order, but we're going to um inform them that hey, like hey, your available quantity is going to go negative.

00:51:24

John Miranda: uh you don't have enough to actually fully fulfill this, create a purchase order or create a stock adjustment for a shipment that coming in to fulfill this eventually. So, we have those safeguards until we actually allow back orders, which we do plan on doing. Once we have that, then from the back orders, they can create a purchase order for that difference and then they can continue with their date. Yeah. Yeah. Yeah. So, then how do you is the only way to actually add stock is to do stock adjustments? Mhm. Um, no. You can add stock with purchase orders. So once you receive once you receive it and that's going to get built out into the workflow eventually like that page too as well. No, no, that's Yeah. Uh, Barbara didn't show it, but it's literally ex almost similar flow but just different verbage. Yes. So yes, that Well, you asked. Yeah, we're building that out align with sales orders. So sales orders and purchase order fulfillment flows come out together.

00:52:16

John Miranda: So purchase orders aren't fulfilled though. So they shouldn't add that. I think you said once you receive it. Once you receive it. Once you receive it. Okay. So, so once it's an item receipt or a bill, uh, once you receive or whenever you receive it in the then you bill it. Yeah. Exactly. Exactly. Okay. Got it. And does it have to tie back to PO or like it has to be the same number as something on a PO or is like whatever happens happens. We're allowing it for the bill for anything to happen from inventory perspective. So like if if it's on a PO kind of it flow and then it goes onto a billow but like I actually received 100 more than I ordered, you know. Oh, then you can just create a stock adjustment for that. Like if you Yeah, that's what I'm saying. Like you receive more than what you the bill automatically. Yeah, it feed feeds in and the item receives not from the bill.

00:52:59

John Miranda: It feeds in only from the fulfillment like so receiving or delivering. But like like you mentioned, oh I received like more than what I ordered. Uh the bill the purchase order only says this amount and the bill I can bill for more than that. But then in order to adjust for that extra amount you create a stock adjustment for okay I receive more from my vendor than what I ordered. And you just add that receive more from vendor reason for adjustment. Got it. That's clear. Cool. And you can see that in the lock. Cool. So that's where the the warehouse people need to know to go there. Yeah. And also the delivery piece to be like this is what's been delivered. Uh because that's actually what we've sent out in a truck versus warehouse you need to deliver this. It actually we actually just sent it. Yes. Yeah. Okay. Got it. Yeah. Will this go into packing slips eventually?

00:53:45

John Miranda: So um we don't know yet. We don't know yet. The answer is yes. I don't know yet. I don't know. But for now, yeah, a packing slip is just a PDF template of the sales order without figures. I know. I know. For 2026, that's actually a big feature request, packing slips. So, a catalog copy for it. It's just a PDF template. Oh, yeah. It's just the template. I mean, that's literally all it is. We need the initial order quantity. We

need to know what they actually order, what they're actually receiving as of right now. Gotcha. Gotcha. So, in this box, in this delivery, what are you receiving? Items and quantities for what's received as what was actually ordered. I see. Okay. Imagine you do like an Amazon order and it's like a massive order for whatever reason. Like, I like the Beanie Babies for whatever reason. I don't order 100 of them.

00:54:34

John Miranda: Got you. You know, like you get a packing slip like which Beanie Babies you order and which quantities you actually need today. Um but yeah, I think I know we're running low on time, but uh the last thing I wanted to ask you guys, so you saw what phase one introduces. Uh it's only internal right now, and you see what's coming in phase two. Um from your POV, um would you would it would it be acceptable to release phase one to customers like in a phased approach like alpha, beta, etc. Um, yeah. Yes. It's one of those Yes, but no things, but you have to try it. You'd have to build on top because like, sorry, I forgot to mention this, but in order to actually utilize uh phase one, you would have to have like two different tabs open to actually look at what quantity in stock you have. And then on your sales order, you would have to like choose the item, look, go back to the other tab, see what you have.

00:55:31

John Miranda: But it doesn't, it only shows you in stock. It doesn't show you committed, expected. It kind of have to you have to have your own like bill of like your own like recordkeeping of like okay this is actually was committed. I have to think about okay maybe this is actually how much I have available. Um that that would be the restrictions in play and the validation of yeah no validations either. So you can create as many uh locations with the same name. You can create as many locations with the same address. You can link as many locations to the same item that's the same name. Um you can't make anything inactive yet. Uh so it's literally on the users's responsibility to self-manage their locations until we actually deliver. It's like proposals beta. No one used it until we forced them to customize it. Then they started using it. I think Yeah, I think uh people will have friction with having to manually update their numbers for everything right now.

00:56:21

John Miranda: Uh and having that issue with the locations and stuff. So I think uh if people do use it, we're going to get a lot of customization requests around that stuff. Uh and I think uh I think there'll be some friction using it assuming that I invoice. Why didn't I do anything? I POE. Why didn't it do anything? Well, you need to do it manually. I can't be doing that for every item I sell. They were going to make an opportunity to do that stuff. You know what they're going to say, right? Quickbook does this. Why should I not just use Quickbook locations? Yeah, that's all it is. Yeah. Yeah. So, I Yeah. You want to do short hands 50? You're a No. I have I have a few points on this actually. I could see the framework and this is bad. I don't know now where we're at because we have this like copy tool thing for like adding in these like new sections for delivered and like undelivered.

00:57:12

John Miranda: So like taking that as a outside of it, I could see the locations and the like initial setup being used as a framework for people on PS to customize around it and not use the functionality that you all like that you guys are building out, which is kind of an issue, but also not really. I do kind of like the framework for that. Um, but then that also goes into like I think everyone has customized their like sales order screens if they use sales orders. So then you're taking a step back of like do we utilize the stock feature now or do we copy it in with this like copy section thing which who knows what's going to go with that. But I could see it being used as like a framework to customize those maybe even like use orders to like remove the quantity on hand. Okay. So again not as it is but customizations. Yeah. And then and then when you bring out your new features we forked. Yeah. Yeah.

00:58:07

John Miranda: Exactly. How are these customers going to get that new feature which is the problem? Quick question. What are the tables for receiving
Method Junction: for delivery and uh receiving. Are those like those are separate

tables? Yeah. Yeah, those are separate. We didn't uh I don't think the uh uh developers built it out yet. Um coming it's coming soon. Yeah, it'll be separate tables. Yeah. And then with sales orders not syncing to QuickBooks, it won't sync. No, but now we have sales orders in Q, right? Yeah. Wait, we can't but they we won't sync. We won't ever until connect decides that they want to do it and if QBO allows um that thing to from what we understand it's never going to happen. No. Is that even from even from the into it side? Is that going to be an issue if people want their sale? Have you used the sales in QBO today? No. It's f****** trash.

00:59:03

Method Junction: Oh, it doesn't even work. Okay. You you invoice and like where's the invoice? You don't even see it. You can't find it. Yeah. Okay. Uh but anyhow, uh is it usable on day one? Yeah, for sure. We can customize if we have to. Um should we market this to ICPMWDs? Absolutely not. Absolutely not. Do not market it. Just dark. You don't want to tell them this is ready and then come in and be like I have to do this manually. But in my other systems I don't. Why would I use this? You know what I mean? Uh from the phase one piece and then uh we have to think about all of our workflows a little bit more here. So fulfillment doesn't only happen from this piece for items. Um, someone can walk in and buy an item that's an invoice. That should that should feed in automatically as a delivery, right?

00:59:55

Method Junction: Or no, is that is delivery just sales orders deliver or sales receipts? Yeah. So, like also work orders that Ryan mentioned, sales receipts. Um, we got to think about that flow more because I know with some inventory management platforms, a sales receipt automatically deducts inventory, but others you have to create a shipment. So, depending on our ICP needs, we got to investigate it. Plus, when I was looking at at the data uh for wholesale and distribution, there's such a small percentage of sales receipt usage. So, we just decided it's just uh it's not worth designing or building for it for now until we have more data. Yeah. Yeah. It's usually not walking. It's usually a middleman. Okay. Yeah. Especially in America. So, if we're targeting America, this will be good. If we're targeting outside of America, this will not be good. Just FYI, like no one will use it the same way as Americans use it. Yeah. For sure.

01:00:44

Method Junction: Thank you so much. Yeah. Thanks. Thanks guys. Really appreciate it. Thank you. You was going to suggest something real on this page as well. I don't know if you remember or if you don't you could just leave notes. Well, I was saying maybe the search bar. Okay. Search. Yeah. And then you were also saying like seeing the previous order total like which was a big pain point somewhere. The initial order. Yeah. Okay. For each of the items, you know, thank you so much. And then how much was so what what we showed today in stock is um through QBDT not QBO quantity which is quantity ordered and then invoiced which is how much is actually invoiced not necessarily the same as fulfilled or delivered right um but that's how QBDT shows it today even to us inside of method so that's how people use it inside of method today instead of like um a separate set of information to see what was delivered what was not really to them do I is Is it invoiced or not?

01:01:41

Method Junction: Because the CRM user is the CRM user. They're not the warehouse user. But if we're targeting warehouse users now, which is great. I think to target users, we need to give them an easy look into these things and then give the back office an easy look into these things. So items um delivered or received actually makes a lot of sense for items delivered and received, but it has to be fluid like and it has to be connecting all the dots for all the departments using it. Sure. Mhm. And it might be for different reasons. Yeah. Warehouse might use it for a different reason than back office um and need to see it in a different way. Shouldn't really matter to be honest. If this is a separate table, there's your answer. You have a separate table for it. Back office just needs to see the original sales order. That's it. You have your answer. You know what I mean? Like if that's the use case, if that's what the research points do, I don't know.

01:02:30

Method Junction: You guys just things to think about. Okay. Okay. But yeah, like I think we we have to do something with advanced inventory. So this is a good approach to

that. Cool. Thank you. Just looking at this, I would say order quantity and then received quantity which is sum of quantities that appear for this item here and then oh s*** invoice invoice quantity within the delivered portion unless you're always invoicing everything. You're always invoicing everything. Okay. Oh, there's no partial invoicing. No partially quantity received was six, but I've only invoiceed like three of these or maybe I've invoiceed six of them. So like Yeah. So the thing is with our flow, you can only uh invoice uh everything at once based on what's been delivered. Oh, I see what you're saying. I mean, that's not wrong though. That's not wrong. I've sent it out for delivery. Let me see everything. But like what if I've only received like No, no.

01:03:33

Method Junction: So you can you can choose which ones here to invoice, but you're you're invoicing the full quantity. You're invoicing. Yeah. Still showing that this has been invoiced or at least dropping it off to another. Yeah. So that's why we have this column here that says yes or no that is has been invoiced or not. So then the user knows right away. Yeah, this is build but like same flow for quantity originality. Yeah. Okay. Order quantity. Does that undo button undo everything? Um, when you click on undo, you select what exactly Yeah, you select what's not been invoiced to undo. Yeah. Or build. Yeah. I just didn't see a checkbox column. So, I got Yeah, it's a modal screen. Yeah, it's a modal screen comes up where I got to remember those modals. We had a clear screen now. No, you got to use it. Where is it? Are you sure?

01:04:23

Method Junction: Yeah. Yeah. Okay. Okay. I know Shy's a power user out here. You guys plans to make the size difference? Yeah. Yeah. Okay, dude. That That's coming. That That's coming. That's coming. It's coming. Yeah. Yeah. That's That's in the plan to make it bigger. Yeah. Yeah. That's in the plan. Yeah. Yeah. We've got plans that we've had since the beginning of the year that we're still now. We got a new plan. Now we got to get the old plans out before the new plan.
John Miranda: Thank you so much. Thank you guys. Really appreciate it. Thank you. Thank you so much. That was good. That was good. That was good. I don't think I have a lot of feedback. So, I don't think the feedback is as much as I thought it would be. You Sorry. I don't think it's as much as Yeah. It's actually not bad. Yeah, it's not bad. I

definitely It's actually not bad at all.
