Multi-Location Management Live Demo with Jason

Invited John Miranda Barbara Stevenson Jason Masina

Attachments Multi-Location Management Live Demo with Jason

Meeting records Transcript

Summary

John Miranda discussed the complexity of the inventory project, noting prior consultations with the PS team, and provided a live demo of Phase One of inventory management after Jason Masina joined the meeting, showcasing the new UI, multilocation management, and stock adjustment features. The discussion clarified that Method's inventory stock does not sync with QuickBooks accounting stock and detailed separate inventory metrics. John Miranda also presented a prototype of Phase Two, which includes updates to the Sales Orders screen and back order functionality, which Jason Masina inquired about. Finally, Jason Masina expressed strong reservations about releasing Phase One in its current state due to limitations and manual work, stating it would be perceived as incomplete.

Details

- **Initial Meeting Discussion and Inventory Complexity** John Miranda discussed challenges with meeting engagement, suggesting pre-recording content, though acknowledging that participants often do not watch (00:00:00). They noted the complexity of the inventory project, mentioning a team was hired for market research and that previous consultations with the PS team resulted in differing opinions, particularly Pette, who was a main inventory partner, advising against certain customizations due to "forking issues". John Miranda emphasized the

risk of trying to ship the entire epic at once, suggesting breaking it into multiple sprints to manage the complexity and limited engineer resources (00:01:55).

- **Phase One Inventory Management Demo** John Miranda presented a live demo of Phase One of inventory management after Jason Masina joined the meeting (00:03:11). The new inventory UI is toggled via Account Settings, where users can enable 'multilocation management' in Display Settings. The demo highlighted the updated Items screen with tabs for 'Adjusted Stock' and a 'Manage Locations' button, and a new item creation flow that includes linking active locations and their respective quantities in stock (00:05:21).
- **Location Management and Stock Adjustment Features** During the demo, John Miranda demonstrated that the 'Total Quantity in Stock' field is non-editable, reflecting the sum of quantities across linked active locations (00:06:19). Users can create new locations via a modal during item creation (00:07:28). Adjusting stock is done through a new 'Adjust Stock' button, where users must provide a reason for the adjustment, like a new shipment, which updates the quantity in stock (00:08:29). They also showed that stock adjustments are tracked in an audit log under the 'Adjust Stock' tab on the Items screen and that locations can be managed and updated via a dedicated button (00:09:31).
- **Inventory Stock vs. Accounting Stock** Jason Masina questioned if the stock adjustments sync with QuickBooks (QBO), to which John Miranda clarified that they do not, leading to different quantities on hand between Method and QBO. John Miranda explained that QBO tracks accounting stock, updated by invoices, sales receipts, and bills, while Method tracks inventory stock, updated by the fulfillment process from sales orders and purchase orders (00:10:31). John Miranda further elaborated on the separate inventory metrics: quantity on hand (QBO), quantity in stock (Method), committed (open sales orders), expected (open purchase orders), and available (calculated) (00:13:03).
- **Phase Two Sales Order and Purchase Order Flow Prototype** John Miranda showed a prototype of Phase Two, detailing updates to the Sales Orders (SO) screen, which now tracks tied invoices and order status (Open, Partially Delivered, Fully Delivered) (00:15:50). A key addition is the ability to view inventory source location and available quantity before inputting the quantity to sell (00:16:48). The prototype also included partial delivery and the ability to convert delivered items from SOs to invoices, ensuring the linear flow reflects in QuickBooks (00:17:48).

- **Back Order and Mobile Optimization Discussions** Jason Masina inquired about back order functionality, sharing their experience with creating a separate back order sales order when inventory is insufficient (00:19:41). John Miranda stated that back orders are planned for Phase Three, and for now, a guardrail alerts users if items are unavailable, requiring a stock adjustment or purchase (00:20:49). They also confirmed that a section for "backordered items" will be added to the location management screen (00:22:05). Additionally, Jason Masina emphasized the importance of a good mobile experience for receiving items in a warehouse, noting their past experience using a separate mobile app that syncs with Method for receiving (00:24:20).
- **Phase One Limitations and Go-to-Market Strategy** John Miranda asked Jason Masina for feedback on whether releasing Phase One to customers, despite its limitations, would be acceptable (00:27:58). The main limitations highlighted were the need for customers to navigate back and forth between the Sales Order screen and the Items screen to check quantity in stock, committed, expected, and available, as this information is missing from the SO screen (00:29:19). Additionally, there are no guardrails in place, such as validations against creating duplicate locations, inability to unlink locations, or making a location inactive, placing more management responsibility on the user (00:30:17).
- **Feedback on Releasing Phase One** Jason Masina strongly felt that releasing Phase One in its current state would be perceived as incomplete and involve "too much manual work," stating they would likely not recommend it as an inventory solution. Acknowledging that it might be useful to ship to start collecting feedback, they maintained that, if marketed as an inventory solution, it would feel incomplete without the features shown in the Phase Two prototype (00:31:15). John Miranda thanked Jason Masina for the useful validation, concluding that the feedback would inform the best timing for starting customer conversations (00:31:15).

Suggested next steps

- [ ] John Miranda will verify if there will be a way to customize the quantity numbers once the team starts building.
- [ ] John Miranda will keep Jason Masina in the loop and stay in touch regarding the inventory management progress.

Multi-Location Management Live Demo with Jason - Transcript

00:00:00

John Miranda: probably screen. Yeah, see if he joins. I'm like losing my voice. Like we said, not not really, but like I've been saying this, we've been saying the same thing over and over again, right? I was thinking is there must be a better way of doing this. I don't know. I don't know. I feel like we could ideally pre-record and send, but how many of them would watch that? Yeah. The thing is, I've done that, but they never they never watch it, right? Yeah. Yeah. They never do. Plus, you can hear like direct feedback. Yeah. And and they're probably not even really listening. Every time I've done that, they're not even listening that Well, they ask the same thing as if they didn't watch it. Yeah. Yeah. Yeah. It's just they hire people for this. I know. Yeah. Apparently, even for like the 2026 planning, they hired like a team to interview the ICPs that they're trying to target.

00:01:02

John Miranda: Really? That's what Ben was telling me. I was like, really? I thought that's something someone on the team would be doing, but they hired like people. They gave me questions to ask actually. Yeah, it's more market research. So, we don't have true any market researchers and business analysts. So, it's better if it's like external. So, they find the features and we know this is it. True. True. As opposed to us doing it. Yeah. That's cool. Um, let's see. When should we cut it if he doesn't show up? 10 minutes. 10 minutes, right? He ain't going to show up. Yeah. You think? I hope he does. It's crazy. This took us three weeks. Yeah. And I don't I don't know. Like, do you want to be here? I think um if if this doesn't happen, I think we have enough data.

00:01:55

John Miranda: I think direction to inform men. Yeah. So essentially we spoke to the PS team was like five people. Yeah. Yeah. Yeah. And everybody had a different opinion. Everyone said this is we could customize this but it's forking issues. Are we looking forward to that? We could but if your ICP is your ICP we'd rather you don't because they're like this is half fast. Yeah. So yeah, Pette said no. She didn't even let us start. She's like she's like no. Yeah. I think like Plet's Pette was originally like the main partner from the beginning for inventory. So I think her her word is I there's some weight to it to put on. So I don't believe we should, but like this would show at least that we're on the right track and it's validated and expected and we have one like y'all we have one engineer. one engineer like the front end the location bit was nice cuz we had um nerous and fine but it wasn't there's no validation there's no anything I'm thinking of all the work I'm just picking that's why like that's why like breaking it down into like multiple sprints is it's going to like save us because if we just try to ship this one epic we're it's too risky and we never know when we're going to finish it

00:03:11

John Miranda: right yeah it's too much uh I think it's going to be a hostile for the dev team to try to implement everything at once. So I was literally like oh I like can have a sounding board just because like this is so inventory is so complex to think about and think like you just want to talk to somebody about it like the way we can talk about it. He doesn't have that. Yeah. And I'm like I can't imagine how isolating that is. Oh hey Jason.
Jason Masina: Hey, can you hear me?
John Miranda: Yeah we can hear you. Okay.
Jason Masina: Oh, hold on one sec. Test test test.
John Miranda: Yeah, we can hear you.
Jason Masina: All right, I got you now.
John Miranda: Okay. Amazing. Uh, thanks so much for joining us. I know.
Jason Masina: Sorry. Sorry. I'm late.
John Miranda: Yeah. No, it's okay. Uh, I know we haven't spoken in a while, but we made a lot of progress with inventory management, and we want to showcase what we've done.

00:04:12

John Miranda: So basically the structure of this meeting is going to be broken down to like three different phases. So um struct like segments. So um the first segment we're going to be uh showing you a live demo of what we built uh uh in phase one of inventory management. And then the second segment is uh Barbara is going to be walking you through a real prototype of um what we're building for in phase two of inventory management. And then um segment three is where we're going to ask like you a question about um if we were to launch phase one to uh customers today uh knowing that there's limitations and phase 2 is not out yet is this acceptable? So um how's that sound?
Jason Masina: Sounds
John Miranda: Cool. Uh let me just share my screen actually. Okay, I can't see but I think that's fine. You you can see the screen.
Jason Masina: Yeah.
John Miranda: Okay. Um a second. Okay. So, u basically this is the items screen that you're very familiar with.

00:05:21

John Miranda: Nothing has changed here. It's the stock screen. Uh but when we ship inventory management, in order to actually toggle the feature on and see the new inventory UI, uh the user has to go to the account settings. If they're admin, they can go into display settings. And then um if you scroll down, you see this new multilocation management um top. Right now, it's in the disabled state. If they click enable and save all changes, um a toast appears saying uh display settings have been updated. If you go back to the item screen, um I'm just refreshing now just because this is how it works. But uh you can see that the new inventory UI has uh is now shown. So you can see an adjusted stock uh tab. You can see manage locations tab uh a button and you'll notice that this table is the same table on a stock screen but this will be changing. You'll see ex uh committed expected available stock tracking. You'll see quantity in stock for method quantity on hand for QBO.

00:06:19

John Miranda: Uh this is coming in phase two. Um so let's say the user wants to create a new item. Uh they click the new item button. They click inventory part item and then they're presented with this new uh UI. So majority of the input fields are the exact same fields from the stock screen. Uh only a couple new fields are for inventory. So you can see this total quantity in stock uh fields. So this is a non-editable field. Uh this is basically the sum of all quantities across linked active locations. And then if you scroll down, you can see this new section editable grid where you can actually in input your locations and the quantity in stock. So if you click the dropdown, you can see all the active uh locations that this company has and you can assign or link this location to this specific item. So let's say the item is uh desk. Um, let's just say we're just going to put in input the required fields. And then let's say you have desk in um location 30 uh and uh you have 1,00 in this location.

00:07:28

John Miranda: Uh let's say you want to add another location and um location 10 you have 50. But then you realize, oh, I have this other location that's not currently in this list. I want to create a new location. You can just create this. I click this button. A modal pops up. Let's say this is location um uh 35 and then you just input the address fields. Just going to say some random stuff and save and close. Um this means that the location is newly created. And when you try to add the new location, you can see that when you scroll all the way down, uh miss give it a sec. It's pretty quick. Yeah, location 35 is here. So, the new location is there. You can now link it to the item. You can add a quantity. Let's say there's 200. And when you click save, um the item is successfully saved. And you can see that the total quantity in stock updates to reflect the sum of your length, quantity, and stock in each location.

00:08:29

John Miranda: Um so, it updates and let's say now the user wants to go in and try to update one of these quantities. You can't do that because now it's non-editable. And in order to actually track this, you have to create a stock adjustment. So there's a new button at the top right corner. You click adjust stock. A modal pops up. You can provide

your reason. Let's say you got um a new shipment of chairs. Uh I mean desks of desk desk. And you want to put it into a location um that already has it. So let's I think location 34. Yeah. 35 has 200 available. So it updates uh automatically. So you got let's say 100. You click save and then the table would refresh with the new updated quantity on hand uh quantity in stock which is 300 as well as the quantity and stock updates to reflect the new sum. You can also actually link new locations via the adjust stock flow by just um let's say you're trying to link location 22. Currently there's nothing in in there because it's not linked.

00:09:31

John Miranda: There's no uh quantity in that location. you want to add 1,00 uh you can do whatever reason. Save and close. And you can see that the new location is added. Uh and if you want to view these stock adjustments, uh you go back to the items screen. You can go to the adjust stock tab. And um you should be able to see, sorry the views are funky, but yeah, you can see desk here. You can see the locations. You can see the quantity adjusted by however amount and you can see the reason for adjustment. So it's good to keep track your own audit log uh for internal reasons. And the final thing is um if a user wants to manage their locations, they can click this button and they can see the list of all locations that they have and they can click into any of the locations and update the location name itself. Let's say you can change something like that and you can even update the address and it should save and you can create your new location here from the screen as well.

00:10:31

John Miranda: And when you change a location name, it would also reflect everywhere that's linked. So even on the item screen as well as in transactions eventually. So that's basically uh what's everything that's we built in uh phase one for inventory management. Um do you have any questions, comments, feedback, concerns?
Jason Masina: Um, do the adjustments sync with QuickBooks?
John Miranda: Uh no, they don't.
Jason Masina: So, it's just uh method only. So then what's so then you would have you would have um if that's the case you would have a different quantity on hand in method than you would in QuickBooks, right?

John Miranda: Yeah. Yeah. So basically um this quantity in hand quantity in stock you see here is not the same quantity on hand that QBO has because we're tracking inventory stock. QBO tracks accounting stock. So it's two separate quantities and we've it was um for a specific reason we did that. So source of truth remains in method for inventory tracking.
Jason Masina: What's the difference between accounting stock and inventory stock?

00:11:38

John Miranda: So accounting stock for QBO updates from invoices uh sales receipts um I think bills as well. Uh but in stock and method is only from sales orders and purchase orders when you actually go through the fulfillment process which we will show you when you receive and deliver uh those items which impacts quantity quantity and stock.
Jason Masina: Okay.
John Miranda: Yeah.
Jason Masina: So then so then in saying in QBO um invoices and sales receipts and bills are changing the quantity on hand but in in method um if you throw the item on a sales order then um your quantity in hand or your quantity available is going to go down. Is that what you're saying?
John Miranda: Yeah, basically so sales orders track committed. Uh then we have it available which is quantity in stock minus committed plus expected. So that's how we're basically impacting inventory. Um, if the user follows a the linear fulfillment process that we have uh that we're building for them, then technically they should stay aligned. But there could be opportunities where or chances where they create the invoice first and then that would automatically kind of change it.

00:13:03

John Miranda: But then they can just create a sales order or create a stock adjustment to um make them aligned if they choose to do so.
Jason Masina: So, um, quantity on hand technically stays the same in both platforms, but we're also seeing in method quantity available. So like quantity on hand is I have it in the warehouse. There might be sales orders, but they haven't been invoiced yet. So I still have it in the warehouse. But then as soon as those sales orders are invoiced and then

the quantity shipped out, then quantity on hand goes down. Feel like those are two different numbers. Quantity on hand and quantity of available.
John Miranda: So you have quantity on hand QBO and then you have quantity in stock method. Then you have committed, expected and available. So quantity in stock uh represents the real quantity you have in your warehouse. And then um available is what's committed on open orders, sales orders. expected is what's expected on open sales uh purchase orders and then the available is that calculation that I defined earlier.

00:14:18

John Miranda: So that's how um calculating it.
Jason Masina: All right. Yep.
John Miranda: Yeah.
Jason Masina: Uh, sounds good. Um, so I guess if if the user only had one location, which I think is pretty common uh situation, or one warehouse, then they would just put in one location.
John Miranda: Yeah. Yeah.
Jason Masina: Um, so when do these numbers update? Is it when you're putting in transactions or is it like an ad routine?
John Miranda: um through transactions. So through the fulfillment process. Um we could show you that how that looks via the prototype if you want.
Jason Masina: Sure.
John Miranda: Okay, cool. I'll stop sharing. Oh, sorry. Give me a second. I'm going to demo. Um, so this is what we were just talking about. I'm also going to open the sales order flow, but essentially this is what the updated table would look like. Um, we now have our quantity on hand on QBO, our quantity in stock on method, available, expected, and committed.

00:15:50

John Miranda: And um when we launch the first few days, we have this banner here that tells you get full visibility into your inventory. Learn what they mean. So that um we're going to update all of this on the help center as well. So that it's clear to everyone exactly what available, expected, committed, quantity, stock, method, and hunting on hand means essentially what's impacted. Uh everything we just said will be explained in

the help center so it's clear to our users. Uh, so now I'm just going to talk walk you through sales orders. Um, give me a second. Let me play this screen. All right. So for sales orders, what we now have on the table as well. We now have the ability to track the invoices tied to that particular sales order as well as the order status. Right? So we have for example your stat your order could be opened. You might have partially delivered items in that order which I'm going to show you. You might have delivered three or five items, right?

00:16:48

John Miranda: You might have fully delivered these items and you might have decided to invoice three or five items, right? So these are like the states that we'll be dealing with in sales orders moving forward. So let's for um for example, we clicked on um Rebecca Hansen this particular sales order. Um when I click on this the first the top is remains the same. There's nothing new here. However, on the editable grid, we have an update where already we're able to see our inventory and non-inventory items. However, for example, you have hair wax, and you want to view all inventory tied to hair wax before you make your decision. So, what happens here is that you click on this, you're able to see hair wax, you have 232 at the junction, um 200 at the hive, um 200 at the junction, the hive, and lower tower, right? For example. So, this is the fully um worked prototype. But imagine here when you now select the junction available quantity then populates and you're able to you know input your quantity to sell rate amount etc per usual.

00:17:48

John Miranda: So the addition here is inventory source location available quantity and quantity to sell. Um so now to talk about the delivery states you've entered hair wax for this scenario that we're talking about right you said you want to sell hair wax and you said you want to sell 12 of those you know items and you want to deliver partially. So you want to deliver say six out of 12 items, right? So now we're adding this call to action where you could deliver fully. You click on deliver fully. We tell you it's delivered fully and you have the ability to undo. If I say I want to deliver partially, I click on this. A model pops up and we tell you choose the item to partially deliver and specify the quantity. So um here we have the item, the date it was added, look where is where it's sourced from, the total available quantity, what you expect to sell at the end of it, and then the quantity

to deliver. So let's say I say I want to sell six of 12 hair wax items.

00:18:44

John Miranda: Right? So I've imputed six and I click on save. Um we get this feedback that's been completed successfully. What happens is that the table is split into two items not delivered which is fully editable. You can add more light line items, adjust this primary item as you want. And then we have items delivered. So from items delivered, we have um the source location, quantity delivered, the date it was delivered, and whether or not this has been invoiced, right? Because there's certain things you could do when you can't delete an already invoice order. For example, you can't undo an already um invoiced item. So in this scenario, this is invoiced, but I'm going to show you what the undo flow looks like. um with another flow shortly. But in this scenario, in this design, it's already invoiced. But imagine it's not invoiced, right? So, and you want to create an invoice. What happens here today is in our sale sales orders, you just click on create.

00:19:41

John Miranda: And when you click on create, why is this taking me here? Let me go to invoice. When you click on create invoice, you're now able to select. Oh, so for example, I I created three items. I added three items to my list, right? But I only want to invoice two of these items. Um, by the time you do that, it just automatically takes you to the invoice screen that we have today. There's no what is also added here is the look where you source that item from um, and the amounts you want to that that's sold and then you're able to save that. So, that's essentially the linear flow we're talking about where you have to convert your sales orders to an invoice so that it reflects on QuickBooks. Uh, do we have any questions, concerns, or comments about this flow? Oh, sorry. I'm muted. Muted.
Jason Masina: Sorry. Thanks. Um, one thing I've created in the past is a back order flow where if there wasn't enough quantity um for an item, then it would the way I've done it is it would create a new sales order which

00:20:49

John Miranda: Mhm.
Jason Masina: is labeled a back order. Um, and then the original sales order is invoiced. Well, the quantity that is backordered is taken off the original sales order and put onto the new sales order. That's that's the back order. And then the original sales order is just invoiced completely. And then the back order remains in the system as an open sales order um until the inventory comes in. So in that case, there's filters where you can see um you can see a list of back orders and you can see if the inventory on those back orders is fully in stock or not. Um, and then it it it notifies the user like, hey, this back order, um, the inventory is now in stock. So now you can invoice it and ship it. So they don't have to go go through every single back order and check all the inventory levels.
John Miranda: So um we do have back orders coming but that's not for now um we're not able to back order. So what we could do is for example you have on your purchase orders you're trying to you know you have 11 items available but you're trying to sell 50 right you could actually when you if you insist on that 50 we tell you hey you don't have these items available um you're going to have to adjust your stock and purchase in the uh you know purchase that that's our guardrail for now while we work on back

00:22:05

Jason Masina: Cool.
John Miranda: orders properly for the sales side. Okay.
Jason Masina: Yeah. Yeah. Just one thing that's been important is the back order flow.
John Miranda: Okay. Okay. That's something we definitely have something um after the this is phase two. So come phase three, we have plans for that.
Jason Masina: Um and then and then um I'll often also have a number on at the item level for on back order like quantity on back order.
John Miranda: Yes. Yes. So what we have today now is on um on our sorry one moment location management. So we have all items and low stock. We're going to have another section for backordered items.
Jason Masina: Cool.
John Miranda: Yeah. So this now leads me to purchase orders which is kind of essentially the same thing as sales orders except this time it's bills. Um again the status we now have build on the order status. So, say we click on a purchase order. Um, in this situation, it's a bit more complex where you have two items you've not received and then you've received three items and you haven't built any of these items, right?

00:23:30

John Miranda: So, let's say now you want to also receive items partially. So, you want to receive from the brush and hair clips and you only want to receive 12 brushes, right? Of the 42. Say you do that. What now happens is we have brush but however it has come down to 30 here and then it now the latest thing comes to the top very top where you now have the the quantity you've received. So uh if you assume that we want to partially build certain items I'm just going to go to the bill flow. So let's say you you know click on create bill. So the bill is only going to come up for items that have not been build yet. Right? If your item has been build you're going to see that here. No, no, no. Right? If it's been build, it's not going to appear on the column. So assuming everything nothing has been built yet, you see this here and you say you want to build for these two items, hair wax and brush.

00:24:20

Jason Masina: Cool.
John Miranda: By the time you click save, it just automatically takes you to the build screen we have today and you can complete, you know, that experience essentially. Yeah.
Jason Masina: Um I think for receiving um it's important to have a good mobile experience because they'll do it from the warehouse often.
John Miranda: Yeah, we're also optimizing for that. That's being worked on as well.
Jason Masina: So yeah, they'll have their phone in the warehouse um and then package comes in and then they write in what they received compared to whatever was on the PO. Um and then that yeah, that PO will either close itself because it's fully received or it will remain open because they didn't get the whole order yet.
John Miranda: Yes.
Jason Masina: Uh yeah. So in yeah in the past I've built well I have like a receiving mobile app. It's not built in method. It's built um in a different platform. Um but sync but uh syncs with method just because there was no way to do it in method with QBO.

00:25:37

Jason Masina: Um, so yeah, the clients I have using it, they use it in the warehouse and they just just they just click on the PO. Uh, it just brings up the items from the PO. They just put in the number that they received on each line. It's like one input on each line. Receive five of these, two of these, three of these. Um, they take a picture if they want, they sign it, and then submit.
John Miranda: Mhm.
Jason Masina: And then that will create the bill in QuickBooks. and sync it back to method. And then they also have like a history with the picture and signature and what exactly was received at that time.
John Miranda: Okay, that makes sense. Yeah. Yeah. For now, ours is more lightweight where you're just it's automating the process, but we don't have that imagy functionality yet, which makes a lot of sense, but definitely something we pretty sure.
Jason Masina: Cool. Yeah, looking good.
John Miranda: All right, thank you so much. Um, this brings us to our third phase.

00:26:42

John Miranda: Take over. Did you have any more feedback, uh, Jason, before we move on?
Jason Masina: Um, I don't think so. Not that not that uh I can think of right now. I guess well are the fields in the item table are they like read are they like read only or are they editable like in the table I assume they're read only in the UI but if if they were to be customized would you be able to write to those fields like uh quantity on hand available reserved committed uh like update them.
John Miranda: like um as in like reference those fields somewhere else if you wanted to or um they would be read only just because um they're automatically being calculated based on transactions. Um so that's the intent.
Jason Masina: So the calculations are they happening in the back end or is that like front end log logic like a Okay.
John Miranda: We're at that phase, but we haven't started building that out yet. But I would I'm pretty sure it would be a backend calculations.
Jason Masina: So, there be no way to Yeah.

00:27:58

Jason Masina: If it Yeah, there'll be no way to like customize it then the those numbers.
John Miranda: I we can probably verify that once we start building. Uh I can't give you a solid answer yet.
Jason Masina: Yeah, I don't know what the best solution would be. I'm just thinking out loud. Um maybe it is to just have it all happen in the back end.
John Miranda: Cool. Um I think we can go to phase three then. I mean uh segment three. So uh basically like I mentioned before um let me just share my screen. Uh I showed you what phase one includes and that's everything that we built today and that's available only for internal accounts. So M11 and M18 accounts. So it's not customerf facing. Customers can't start creating locations. they don't have access to any inventory UI. Um the question here is if we were to actually uh make this customerf facing is it acceptable and the reason why I ask is if we do um ship this to customers there are some limitations and workarounds that they would have to face and one of them being is for example we have this inventory screen here um let's say the user wants to create a sales order let this load maybe Yeah.

00:29:19

John Miranda: Okay. Yeah, they create a new sales order. This is all stock, so nothing's been changed here. And they see, okay, the items table. So, this is the same items table we have today. And they want to create a new item for I think we said desks and they can put in the order quantity, but nowhere on the screen they can see how much quantity in stock they have available, committed, expected. There's no information. So, if they do want uh to see how much quantity in stock they have, they have to um go to have another tab open. Uh actually go to the items screen, then search up desks. What? Sorry. Uh I don't know what's happening. Give me a sec. Desk. Yeah, here you go. And then they can finally see, okay, I have 2,300 uh quantity in stock. I have it distributed in these locations. uh I can then somewhat actually continue with the sales order, but I still don't know how much I have committed.

00:30:17

John Miranda: I don't know how much I have expected. I don't know how much I have

available. So, they would have to continuously go back and forth, but also keep like a mental log about how much they actually can sell or have like an Excel sheet or somewhere else that they're keeping track of these quantities. So, that's the first like limitation and workaround. Um, the second one is there's no validations or guardrails in place. Meaning you can create the same location with the same address as many times as you want. You can link the same location to the same item as many times as you want. And you can't unlink. That's not available yet. That's coming in phase two. Um, you can't make a location inactive. So, there's a lot more responsibility on the user to self-manage their locations if we were to release this today. Um, those are like primary like limitations and workarounds. Um, do you have any feedback? Like what's your take here?
Jason Masina: Um, do the quantities would the quantities uh update in the V1?

00:31:15

John Miranda: Sorry, I forgot to mention they wouldn't update. So, if you do create a sales order or a purchase order um, and you received or delivered, you would have to go in create a manual stock adjustment to keep track and actually update your quantities here.
Jason Masina: Right. Yeah, I think it would be I think it would be perceived as incomplete if it if you were to ship it like that. Um too much manual work. I don't think anybody would actually use it in my opinion. Um, unless it was just like a quiet thing that you don't really like market that hard. Um, if if you were like marketing as a as like an inventory solution, I think it would feel incomplete without the other stuff.
John Miranda: Okay. Um, so you're I guess you're saying that there doing these workarounds it adds a lot of friction. Um, it's not it's like it's disconnected like you would say so or Yeah.
Jason Masina: Yeah. Yeah. I'm not sure how many of your customers would actually use it like that in that state.
John Miranda: Okay. Mhm. Okay.
Jason Masina: Um, but it might be good to just ship it and start getting feedback like get people talking.
John Miranda: Mhm. Yeah. Um Yeah.
Jason Masina: I would I wouldn't like if if I had a customer and it was shipped like that, I probably wouldn't recommend it.
John Miranda: Because Gotcha.
Jason Masina: Uh yeah, just because of it feeling incomplete, but with with um

everything else he showed me, it looks great.
John Miranda: Fair. Um. Oh, cool. Um, Barbara, anything on your mind? Uh, no. No, nothing else. Thank you so much. This was very useful. Yeah. Um, we essentially just wanted to validate, you know, when it would be best to start having conversations with customers. So, yeah, this was very useful. Thank you so much. Yeah. Thanks, Jason.
Jason Masina: Great. Yeah, thanks for having me. Sorry I was uh missed yesterday. Okay, have a great one.
