# Multi-Location Management Live Demo with Paulette

Invited John Miranda Paulette Dreher Barbara Stevenson methodjunction@gmail.com

Attachments Multi-Location Management Live Demo with Paulette

Meeting records Transcript

## Summary

Method Junction provided a live demo of the initial inventory management build (Phase One) featuring multilocation toggles, stock adjustments, and separate tracking for "quantity on hand QBO" and "quantity in stock within method." Paulette Dreher requested the ability to input a separate account number for inventory adjustments, which Method Junction agreed to research, and confirmed that starting the fulfillment process with a sales order is key for quantity alignment between systems. Barbara from Method Junction presented the Phase Two prototype, which includes an updated inventory table and comprehensive sales and purchase order fulfillment flows that Paulette Dreher liked but advised against an early release of Phase One due to a disconnected user experience and lack of visibility into committed and expected quantities.

## Details

- **New Inventory Management Feature Overview** Method Junction presented a live demo of the initial build for inventory management, featuring a new "multilocation" toggle in display settings to enable the inventory UI, which includes "Adjusted Stock" and "Manage Locations" (00:01:09). This new UI will eventually include committed, in stock, expected, and available quantities. They

explained that the quantity in stock is calculated as the sum of quantities across linked active locations and demonstrated how to add or create locations for an item and set the initial stock (00:02:14).

- **Inventory Location and Adjustment Flow** The locations feature is independent and exclusively within method, not synced with QBO locations (00:03:17). Method Junction showed how to create a new location and link it to an item, with the total quantity in stock automatically summing quantities from all linked active locations (00:04:18). They also demonstrated the stock adjustment process using the "Adjust Stock" button, explaining that users can select a location, input a quantity change (e.g., -200), provide a reason, and view the updated stock total (00:05:21).
- **Managing Locations and Adjustment Log** The "Adjusted Stock" tab provides a log of all stock adjustments, including the date, location, quantity change, and reason for auditing purposes. Method Junction detailed that the "Manage Locations" screen allows users to edit location names or addresses, which updates retroactively across all linked items and screens (00:06:16). They summarized the capabilities built so far: creating/editing locations, linking locations to items, and performing stock adjustments (00:07:18).
- **Distinction Between QBO and Method Stock** Paulette Dreher questioned how inventory is handled in QuickBooks Online (QBO) and if it would be tracked as inventory. Method Junction clarified that the item will be sent to QuickBooks as inventory but that method is decoupling physical stock tracking from QBO's accounting stock. They explained that two distinct quantities will be shown: "quantity on hand QBO" and "quantity in stock within method," with the latter being impacted by method's fulfillment flow (purchase/sales orders) (00:08:23).
- **Inventory Fulfillment Process and Alignment** Method Junction explained that if a user follows the linear fulfillment process starting with a sales order, the quantity should remain aligned between method and QBO, as both quantities are reduced when an invoice is created for delivered items within method. If an invoice is created without a sales order, only the QBO quantity on hand is impacted, requiring the user to manually create stock adjustments or a sales order to reflect the physical stock change in method (00:09:43). Paulette Dreher confirmed that starting with a sales order is key for alignment (00:11:19).
- **Feedback on Stock Adjustment Accounts** Paulette Dreher raised a question regarding the "Adjust Stock" feature, asking if there is an option to input a

separate account number for inventory adjustments (00:12:21). They noted that losses typically do not go to the regular Cost of Goods Sold (COGS) account, and users often prefer to track these losses separately to understand how inventory was compromised. Method Junction agreed to research and look into updating the adjustment experience to address this need (00:14:07).

- **Inventory Table Update and Fulfillment Prototype (Phase Two)** Barbara from Method Junction presented the prototype for Phase Two, showing the updated inventory table which will feature "quantity on hand QBO," "quantity in stock method," "available," "expected" (from open purchase orders), and "committed" (from open sales orders) (00:15:25). They introduced the fulfillment flow for sales orders, which now includes columns for "Invoice" status (open, partially/fully invoiced) and "Order" status (open, partially/fully delivered) (00:16:39).
- **Sales Order Fulfillment Demo** The sales order demo showed a new feature on the items table to view inventory across all locations tied to a specific item, allowing users to select a location and automatically populate the available quantity (00:17:32). Users can choose to deliver items partially or fully. When items are delivered, the table splits into "items not delivered" and "items delivered," and users have the option to undo deliveries within a certain timeframe (00:18:50). Paulette Dreher expressed that the functionality to undo actions is essential and liked the prototype (00:20:45).
- **Purchase Order Fulfillment Demo** The purchase order flow is similar to the sales order process but focuses on receiving items, with columns for "Build" status (not build, partially/fully build) and "Order" status (open, partially received) (00:20:45). Users can partially receive items, which then appear on the items received table at the top. The items received table is view-only except for the undo action (00:21:38).
- **Billing and System Synchronization** The purchase order flow allows for partial billing, where users can choose to create a bill for only certain received items (00:22:27). Creating a bill from this flow redirects the user to the bills page, maintaining a linear process that ensures adequate tracking on QuickBooks (00:23:23). Method Junction confirmed that bills created from the purchase order in method will sync back to QBO, ensuring synchronization of transactions between systems (00:24:19).

- **Limitations of Releasing Phase One Today** Method Junction explored the hypothetical scenario of releasing the current Phase One (item, location, and stock adjustment capabilities) today, which would lack the sales order and purchase order fulfillment features shown in the prototype (00:25:29). A major limitation would be that users creating a sales order would not see location sourcing or available stock information on the sales order screen and would have to flip between tabs to check item availability (00:26:36). Furthermore, without Phase Two features, users would lack visibility into committed, expected, and available quantities, making inventory calculations manual and prone to error (00:30:29).
- **Recommendation Against Early Release** Paulette Dreher strongly advised against releasing Phase One early due to the highly disconnected user experience, especially for customers with long invoices who would have to constantly switch between tabs to manage stock (00:29:00). They suggested that the product is "not quite ready for prime time" and recommended waiting until the end of January or February to release the combined features, as the complete vision is excellent but people often cannot visualize a workaround-heavy process (00:32:53).
- **Known Unresolved Issues** Method Junction acknowledged other existing frictions in Phase One that would be addressed later, including the current inability to unlink locations from items. They also noted a lack of validation, allowing users to create and link the same location multiple times (00:31:51).
- **Positive Feedback and Encouragement** Paulette Dreher expressed strong approval of the product direction, stating that Method Junction is "definitely on the right track" and has considered the entire user spectrum without exhibiting the tunnel vision sometimes seen in development. They thanked Method Junction for the presentation and offered to test the product, even in its current state (00:35:15).

## Suggested next steps

*No suggested next steps were found for this meeting.*

*You should review Gemini's notes to make sure they're accurate. [Get tips and learn how Gemini takes notes]*

# Multi-Location Management Live Demo with Paulette - Transcript

## 00:00:00

**Method Junction:** s***. I have not can now join this meeting. Okay. Hi Paul. Hi Paul.
**Paulette Dreher:** Hi. How's everybody?
**Method Junction:** We're good. How are you?
**Paulette Dreher:** Hanging in there. Doing pretty good.
**Method Junction:** Good. Thanks for joining us. I know it's been a minute since we last spoke, but uh yeah, we really appreciate taking the time to talk to us today.
**Paulette Dreher:** Oh, for sure. I'm excited to see what you guys came up with.
**Method Junction:** Amazing. Um so basically the rundown for this uh um this meeting is we're going to give you a live demo of what we built so far and then we're going to show you a prototype of what's coming and then we're going to show you um basically a hypothetical situation if we were to launch what we built so far today uh with the current workarounds is that acceptable and want to get your feedback. Um how's that sound?
**Paulette Dreher:** Okay, sounds good.
**Method Junction:** Okay, cool. Uh, let me just share you my screen.

## 00:01:09

**Method Junction:** Give me one second. Okay, let me know if you can see this.
**Paulette Dreher:** Yep, I'm good.
**Method Junction:** Okay, so you're probably familiar. This is the current item screen and method today. Uh, this is for a TVO account. So, um, nothing uh new here. You're very familiar with this. But uh with inventory management coming uh to method um in order for users to actually toggle this new feature um we have a a new toggle in the display settings. So if the user goes to display and if they're admin user um if you scroll all the way down you see a new feature here called multilocation.
**Paulette Dreher:** got it. Yep.
**Method Junction:** Uh currently it's disabled. So that's why you can't see any of that UI.

But once you click enable and you click save um it says display settings saved, right? So if we were to go back to the item screen and then we should just refresh it. You can see the new inventory UI. So you have adjusted stock, you have manage locations.

## 00:02:14

**Method Junction:** Um this is all that we built. This table will be updated to include uh committed quantity in stock expected available as well. It's not it's just not in this phase currently. It's coming up in the next one. So um you will exactly on hand across all locations and you can also will be able to filter by location to see the committed expected onhand etc. So that's coming down the line but let's say um you want
**Paulette Dreher:** And it's um sorry and the on hand is across all locations.
**Method Junction:** to create a new item. So similar flow you click create new item you choose new uh inventory part and then you're presented with this screen here. So, um it has basically all the same input fields as the regular um accounting screen, but with new inventory UI. So, let's say the item you want to do is um let's say a chair. Uh we can uh the total quantity in stock here is not a editable field. Instead, it's a sum of all quantities across linked active locations.

## 00:03:17

**Method Junction:** So, um, if you scroll all the way down, you can see a new grid table here called the locations table where a user can actually add, uh, or link existing locations that the company has to this item or
**Paulette Dreher:** got it.
**Method Junction:** they can also create a new location to link that location to this item. So, uh, for example, let's say the um the company has this item in location 81. Uh, you can add a quantity in stock here of let's say a th00and. Uh if you have this uh item in more locations, you can just add a new row. Add a new location. Say location 22. Oh, we only have 500 here. This is you you setting your first initial stock for this quantity.
**Paulette Dreher:** Now, um I have a question.
**Method Junction:** Um yeah.
**Paulette Dreher:** Uh so QBO has locations, right? Is are we talking the same or is this completely independent and it's only in method?
**Method Junction:** Uh so this is completely independent. It's just within method.

**Paulette Dreher:** Okay.
**Method Junction:** Yeah.

## 00:04:18

**Paulette Dreher:** Okay. Got it.
**Method Junction:** So let's say yeah we added these two locations here but you want to create a new location. So you click add new location. You have a popup modal. So let's say this is uh location uh 11. Um actually let me just do something else. 100 uh address field. We'll just uh just put in random numbers here for now. But you get the point.
**Paulette Dreher:** Mhm.
**Method Junction:** You just fill in your address. You save and close. And then if you go to the add existing location dropdown, you can see that uh where is it? Yeah, location 100 is right here.
**Paulette Dreher:** Got it.
**Method Junction:** Right. So we just update this field. Let's say we have 2,00 in here. And then we just got to make sure that all these other fields are um inputed with the required amounts. And then we just click save. So once you click save and all the fields are inputed, you can see here that the total quantity in stock is a sum of all the quantities in the active location.

## 00:05:21

**Method Junction:** So it automatically computes that. So you have 3500 across all these locations that are linked to this item.
**Paulette Dreher:** Got it.
**Method Junction:** Um let's say you end up getting um a new shipment in or you lost some stock, right? How how are you going to be able to change any of these quantities in these locations? You want to do a stock adjustment. So there's a just stock button at the top right corner. You can give a reason here. Let's say a lost stock due to a fire something like that. You can choose a location.
**Paulette Dreher:** Mhm.
**Method Junction:** Uh right now we have it in location uh in one was in 51. Uh no I forgot which one it is. Location 100. Yeah. Let's say you lost uh I don't know like 200, right? You just do minus 200. Save and close. And then when you go back here, you can see

location of 100 reduced by 200. Now you have 1,800 in this location and the total quantity in stock also reflects it.

## 00:06:16

**Paulette Dreher:** Yeah, got it.
**Method Junction:** Uh you're probably asking how can I see the adjustment log. So if you go back to the items uh list screen, you have this new adjusted stock tab. If you click that you can see um by date basically November 12th for the chair location 100 adjusted with -200 and reason for adjustment is lost off due to a buyer.
**Paulette Dreher:** Mhm.
**Method Junction:** Um so this is basically a log of all your stock adjustment. So you can keep track of what's changing at what location and the reason um just for personal uh company auditing reasons. So that's basically stock flow.
**Paulette Dreher:** Got it.
**Method Junction:** Um, and let's say you want to actually manage your your locations. Some companies might have one, two, or maybe a 100 locations. If you go um back here, you click manage locations button, you can see the list of all your active locations uh that you have right now. And if you want to change a location name or change an address, you can just click into any one of them.

## 00:07:18

**Method Junction:** Let's say um for example, let's go to the one that I created, location 100. Um I can just go inside. I can change this to location 200. I can change the address.
**Paulette Dreher:** got it. Yep.
**Method Junction:** And if I click save, everything's saved. And the cool thing is if you go back to that item that we created and go down here, it actually updates in the location as well. So um it it updates retroactively through all the linked um screens as well as eventually in transactions itself. And that's not the only place you can create the new I uh the new location. You can also create new locations within managing your locations uh screen. So it's the same workflow update here and uh creates a new location for you to now link to items.
**Paulette Dreher:** Mhm.

**Method Junction:** Um so that's basically like what we built so far. Uh users are able to create and edit locations, link locations to items, uh adjust uh stock in the locations and create um stock adjustments. So, um any comments, feedback?

## 00:08:23

**Method Junction:** Uh how how do you like this experience of what we designed?
**Paulette Dreher:** Um, okay. Uh, couple of questions. Well, actually one question first. Uh, when you created the chair, will it go into QuickBooks as inventory or non-inventory?
**Method Junction:** So, it'll go into QuickBooks as inventory.
**Paulette Dreher:** All right. So, in QuickBooks, then I would be seeing that we had 3500 or 3,200 or whatever. Um, but there's no transactions like there there's no audit trail to see what makes up that quantity, but QuickBooks would be showing that quantity or is the onhand kind of like a separate field just in method.
**Method Junction:** Yeah. So, um how we're actually approaching inventory is um how QBO handles it is accounting stock. In method, it'll be uh physical stock. So um we're going to be decoupling u from QBO in the terms of we're going to still show this onhand value which is a QBO quantity on hand but we'll also be showing next to it which is quantity in stock within method. So this would be stock um that's impacted from purchase orders when you receive or uh when you receive orders or sales orders when you deliver orders.

## 00:09:43

**Method Junction:** So um that's there there's going to be a clear uh distinction between the two quant quantities uh moving forward. Um uh it is on the users's uh responsibility to uh ensure that if they would like the uh numbers to be aligned then they would have to either create a stock adjustment or um create um invoices within QBO or sales receipts etc to actually make it aligned. But we're separating the two and quantian stock is going to be only impacted with the method and show it in method.
**Paulette Dreher:** Okay. But now you mentioned um so like invoicing, right? So when you're So I I get the the two fields, right? Like the method on hand uh and and the QBO on hand. But um when you're doing an invoice, if it's, if I heard you right, it's only decreasing the QBO on hand.
**Method Junction:** Yeah, exactly. Yeah.

**Paulette Dreher:** Okay. And so then you're saying that it's up to the user to do a quantity adjustment to reduce it on the method inventory.
**Method Junction:** No. So um if the user follows a typical like fulfillment flow where um they create a sales order for a specific set of items and they um sell the items they deliver it uh within method the quantity would be reduced but then they create an invoice for those delivered items within method then the QBO quantity on hand will also be reduced.

## 00:11:19

**Method Junction:** So technically it should stay aligned if they follow um a a linear process. But if the user goes in and creates invoices without sales orders, then the QBO quantity on hand will automatically be impacted and then they would have to go in create stock adjustments or create a sales order um to actually reflect that within the physical stock tracking method.
**Paulette Dreher:** All right. So, the key is that they have to start with the sales order. They can't just go and do uh do an invoice. It has to be an invoice from the sales order.
**Method Junction:** Exactly. Yeah, they they like they can still do invoices.
**Paulette Dreher:** Okay.
**Method Junction:** They would just have to go uh create the sales order and then follow the fulfillment process for that sales order if they want to uh actually have some transaction associated with it. Um, but we're we're designing for a very linear process for fulfillment and we're going to actually prototype that to you very soon.
**Paulette Dreher:** Okay, got it.
**Method Junction:** Yeah.
**Paulette Dreher:** Um, okay.

## 00:12:21

**Method Junction:** Yeah. Yeah.
**Paulette Dreher:** And I guess that that really like my first question was, are you doing um inventory in in QuickBooks? Is it it? because uh a lot of the third-party uh inventory apps what what they do is they make the QBO part B noninventory and it's only inventory in in their app.
**Method Junction:** Amazing.

**Paulette Dreher:** So that's why I was asking that question but it's fine that yeah that it's a it is inventory and um I guess you answered my question about how everything gets relieved. So, I'm good so far.
**Method Junction:** Cool. Um, I guess we can show the prototype then. All righty. I'll just stop sharing. Why am I Yeah.
**Paulette Dreher:** Oh, I'm sorry. Sorry. One more question. On the um uh adjust stock, do are you able to put in a separate account number?
**Method Junction:** Um uh sorry. Uh what do you mean by Yeah.
**Paulette Dreher:** Okay. uh you need uh okay so inventory currently is it's the asset account right and then you have the income and cost of goods when you do an inventory adjustment it's it's going to come out of the asset right but you you need to consider a cost of like the user to put in either you could have it here as default uh a second COGS account for uh for stock adjustments or you have it on this screen,

## 00:14:07

**Paulette Dreher:** but you need to uh give the user because you um typically you don't a loss does not go to the regular COGS account. It's um that they typically want to see it like you know how how did we screw up our inventory? where where's uh what's the consequence of of of whatever, right? We lost it. There was a fire or whatever.
**Method Junction:** Okay. Um, yeah.
**Paulette Dreher:** It's not an absolute requirement because I suppose you could find it other ways, but it I think it would be something that just on this screen that they can pick.
**Method Junction:** Yeah.
**Paulette Dreher:** Yeah.
**Method Junction:** Okay. Sure. Yeah. Yeah. We can definitely research and look into that that experience more. We can update this, right? Yeah. Yeah. Cool. Yeah. Thanks.
**Paulette Dreher:** Okay. You're welcome.
**Method Junction:** Yeah. I'll share. Yeah, sure. Hi, Paul. Barbara here. So, I'm going to share my screen I'm gonna share my screen and essentially work you through um sales orders and purchase orders and essentially how we envision that working.

## 00:15:25

**Paulette Dreher:** Okay.
**Method Junction:** So, uh we're currently uh we plan on running the spring very soon to make sure this is live on the app. But in the meantime, we are going to show you what's happening on Figma. I'm just going to share my entire thing. Okay.
**Paulette Dreher:** Okay.
**Method Junction:** All right. Uh so before I go into the sales and purchase, I just want you to see what the updated inventory table would look like. So here we now have our quantity on hand QBO and quantity in stock method. And then we have available, expected, and committed. So um that's what's going to be coming very soon. So, what you saw was just like, you know, the empty table and um the call to actions, but by the time we make that update, we're going to have this on the table as well.
**Paulette Dreher:** And so just to be clear, the expected is from open purchase orders and committed is open sales orders.
**Method Junction:** Yes, exactly.
**Paulette Dreher:** Okay.
**Method Junction:** Yes. And um for just to clarify as well, we have this banner when you start when you um add the app pack, right?

## 00:16:39

**Method Junction:** We have get full visibility um see current stock incoming items and committed salesman what they mean. So we're going to have a help center just to reiterate you know these terms as well.
**Paulette Dreher:** Gotcha.
**Method Junction:** So it's like a you know universal language that we could always go back to. All righty. So on the I'm going to show you the sales order. So now we're on sales orders. Um the previous sales order screen um essentially had like two three columns just for the date and the order number. But now what and the amount. So now what we have is um the invoice and the order status because we mentioned the whole fulfillment process for you know an item. So our invoice could either be open.
**Paulette Dreher:** Um, Mhm.
**Method Junction:** It could be partially invoiced or fully invoiced. I'm going to show you what that flow looks like shortly. And your order status could be open. You could have delivered some items in that um particular sales order.

## 00:17:32

**Method Junction:** Or you might have delivered all the items. So these are the essentially the states you're going to you know be familiarizing yourself with while you use the sales orders flow. Um so for example working through this um scenario we have on the on the first table Hansen um has this order right. So we click on this um we already know um what this looks like. However the new addition is the on the items table. So on the items table now we have the option to view all inventory tied to a particular item. So what does that look like? So now I let's say I selected hair wax. I can see inventory and non inventory items right and I want to see all inventory all locations tied to a particular item. I click on this I can see that hair wax we have 200 in the junction.
**Paulette Dreher:** This nice.
**Method Junction:** Come again. Okay. I can see we have 200 in the junction, nine in the hive, lower tower has five and yeah I'm like okay cool I want to select the junction so this is like the full prototype but what happens is when you select the junction available quantities automatically populated right and then you choose the amount the quantity you want to sell you put your rate amount and tax so the next thing is do you want to deliver everything

## 00:18:50

**Method Junction:** at once or do you want to deliver the full thing right so if you say now you have 12 hair wax items you want to sell and you want to deliver this partially. So here we tell you to choose the items to partially deliver and specify the quantity to deliver because you might have chosen like five six items in your sales order right but here we're just imagining you chose one and you want to deliver you know out of six out of 12 for example let's say want you to deliver you in six and then you decide to save we tell you that it has been completed successfully and
**Paulette Dreher:** Nightmare.
**Method Junction:** then when you click here you see the table now splits into two the items not delivered and the items delivered So, what do we have on the items delivered um page? We have the item you delivered, the location you selected, how much it was delivered, the date it was delivered, as well as the other information. And within a certain amount of time, you could choose to undo these deliveries.

## 00:19:46

**Method Junction:** If you decide um for whatever reason you want to undo and add more or make any edits, that's totally up to you and that's fine. You can also just undo this and select um this. Let me just go to the page real quick. So you just see what that looks like. Where's undo? Undo. Give me a second. So for example, if you want to undo that selection. Oh, that looks confusing. I'm just going to zoom in. Um, yeah. So you can just for you you can't select you can't say you're going to undo five of 12 hair wax items. You can only undo the whole thing, but you can just select which items you want to undo. So, say say you want to undo two items that you had delivered or three or five or six or 10. So, that's up to you and it's totally up to you know what the user wants to do essentially. So, we wanted to be able to give them that flexibility and that's essentially what uh fulfillment looks like.

## 00:20:45

**Method Junction:** And if you say you want to do the whole thing, it's just to click on deliver fully and you get the you know called the model that tell it has been completed as well. You can choose to undo you know all those deliveries within a certain amount of time. Uh so that's essentially what we have coming for you soon. Do you have any feedback or comments on this one?
**Paulette Dreher:** You always need an undo because, you know, everybody screws up, right? No. It's uh it makes sense. Um I like it.
**Method Junction:** Okay.
**Paulette Dreher:** It's uh it's uh it's good.
**Method Junction:** Okay. Sweet.
**Paulette Dreher:** It's good.
**Method Junction:** Um, so we're going to I'm going to show you the purchase. So the purchase is essentially the same flow, but you're receiving items, right? So what we have here on the column is build. So you could be again not build, you could be partially build, fully build depending on how many items you want to send. And the order status as well is, you know, it could be open but you haven't build.

## 00:21:38

**Method Junction:** you could have partially received and partly build as well. Um, so I'm just going to work you through that flow again. So Rebecca, what has happened here in this flow, it's a little bit more complex. So I just want to show you where we have like an active purchase order where we have some items not received and we have items received. So now the good thing is that on your items not received table, you could choose to do whatever you want, right? You could delete this, you could add this, but the items received table, the only thing you could do is undo that action, right? You can't say you want to this field is going to be non-editable.
**Paulette Dreher:** Okay.
**Method Junction:** It's a view only. However, the items not received. You could do whatever you want till you know you essentially press send. So let's say now you want to receive some items partially. You haven't received the brush and hair clips, right? So um you click on this, you want to receive it partially.

## 00:22:27

**Method Junction:** I tell you to choose the items and specify the quantity. In this scenario, you want to receive 12 out of the 42 43 hair brushes for whatever reason, right? And you click save.
**Paulette Dreher:** Mhm.
**Method Junction:** I can see here the brush is still here. However, items received the brush the brushes you chose to receive come up here with the latest date. So, um, essentially whenever you receive an item, it goes to the top of the table. So, you don't have to scroll all the way down and, you know, look for what's going on. It could be 100 there, right? And you could always sort. So you can sort by you knowing, descending, amount, build, not build because here you could also choose to bill, right? You could choose to create a bill from this flow. And if you create a bill, you could, if you see on the items received table, we have items that are build or not. So that's essentially the partial billing because you can decide that you want to bill for brush and hair wax, but you're not ready to do it for cream and polish, right?

## 00:23:23

**Method Junction:** So, if you decide you want to create a bill, it essentially takes you, sorry, real quick, I have to go to that. So, if you say you want to create a bill, for example, and you click on that call to action, create bill, what you see is, this looks scary yet again, so I'm going to zoom in. What you see is essentially the items you want to um the quantity received the location it was from your account receivable account and you say you want to build hair wax and brush right so um by the time you do that
**Paulette Dreher:** Yep.
**Method Junction:** it go it takes you to the bills page so that's why it's a linear flow if you create an invoice from sales order it redirects you to the invoice page you don't need to go anywhere else to do anything just follow that flow and that process and if you stop at the sales order and once you resume just go to the sales order and continue the flow to the invoice so that it's adequately tracked on QuickBooks. Um and then yeah, you see here um the items you want to build.

## 00:24:19

**Method Junction:** You can save, you could bill, you could do whatever that we have today. And that's essentially the what we're trying to work on to bring to you soon. So it's a very, you know, complete process.
**Paulette Dreher:** Got it. Got it. And um Okay. So, let's say that the client definitely gives the the method user the ability to do the purchase order, but they want the bill to just be in QBO. Is everything syncing in such a way that the um you know the transactions can be processed in either
**Method Junction:** Yes. Yeah. Yeah. So the bill that the user creates from the purchase order will sync back to QVO and then they can uh do whatever they want on QBO for accounting purposes.
**Paulette Dreher:** Okay.
**Method Junction:** Yeah. Yeah. It's a it's a sync behavior we have today. So we're not changing anything related to sync.
**Paulette Dreher:** Got it.
**Method Junction:** Yeah.
**Paulette Dreher:** All right. This is perfect.
**Method Junction:** Okay.
**Paulette Dreher:** I'm impressed.

## 00:25:29

**Method Junction:** Great.
**Paulette Dreher:** Yeah, you guys did good.
**Method Junction:** Amazing. Y Thank you. Um uh we do want to show you one more thing, Cola. Um so, uh the third thing I wanted to talk to you about is uh the live demo that we showed you in the beginning. Uh right now we're only uh shipping that to internal teams. So basically only our company can actually you know demo it, try it out, test it, find bugs, etc. Uh but we want to explore the idea of what if we ship this to real customers today and what would be the workarounds or or limitations of this experience. So um let me just share you my screen and I can show you what I mean by this. So um Yeah. Okay. Yeah. So, um you remember the flow. We can create we can create and edit locations. We can assign locations to items and we can create stock adjustments. So, that's everything that we can do. What Barbara just you is everything that's coming in phase two of inventory management.

## 00:26:36

**Paulette Dreher:** Right.
**Method Junction:** So, we haven't built that yet. That's coming later and that's going to be like a phase release uh to customers. Um so the question is if we release phase one today of what I showed you how does that experience look like? So um imagine a user wants to create a sales order um everything here is stock. It's the same thing you're used to. Uh they go create new sales order. Um they select their customer and you can see here this is the items table. It doesn't have the same UI that Barbara showed. it doesn't have the same um in inventory uh details or information that you would expect right so if a goes in and remember the item that I created a chair I I chair I press uh enter and I
**Paulette Dreher:** Right. Right. Mhm.
**Method Junction:** can see okay order quantity one rate amount etc but in this screen you still don't know what location you can source from or how much items available are there are to sell so what would the user have to do they would have to create uh another tab basically and then go to the item screen uh search up chair um go into the item and then then they can see okay I have 3300 available I have this

## 00:27:56

**Method Junction:** amount available in each location um that's how they're going to have to be able to see how much they have available um it would be uh flipping between two tabs to see how much quantity you have in stock because we don't currently show Okay. Uh within the sales order screen.
**Paulette Dreher:** Why can't you sorry but why can't you modify the screen so that they can see it Uh,
**Method Junction:** Uh um so the thing is a customizer could do that and they can uh populate the screen with that data, but we're going to be introducing that in phase two of loca uh of inventory management. So it's coming down the line. It's not something that uh we built today that we plan to ship yet.
**Paulette Dreher:** no. Then Okay.
**Method Junction:** been coming close. We're currently looking towards working at it at within the next like December January because uh the next sprints are going to be focusing on sales order and purchase order fulfillment. So what Barbara showed you is what we plan to build and ship.

## 00:29:00

**Method Junction:** So um that's coming soon. It's just not available today.
**Paulette Dreher:** I I wouldn't release it then.
**Method Junction:** Oops.
**Paulette Dreher:** I It's just uh unless you have somebody that's just super excited and can visualize. Um, but no, I I just um and you know, I mean, some some of the clients have invoices that are pages long, as an example, right? So, it's like they they're not even going to be like it's too I think it's too disconnected. Even though what you showed me is perfect, but if you cannot give them for those customers that you want to test, if you can't give them a customized sales order screen, um I I I don't think it would be worth it.
**Method Junction:** Okay.
**Paulette Dreher:** I wouldn't do it because I'm very curious and I would love to test this out because I want to see um how everything uh goes into into QBO desktop I' I'd not have a worry but QBO it's I
**Method Junction:** Uh,

**Paulette Dreher:** hate it. I have a lovehate relationship with it and uh you know I just want to make sure uh that what everything you're doing here that it makes sense to me.

## 00:30:29

**Paulette Dreher:** It makes sense here. I want to make sure that it makes sense in QBO. So, I would love to to test this and, you know, be one of your people that um that gives you feedback, but just that that part of having to go back and forth. Um, you know, I I'm not sure. I I think you might not get the results you want, the enthusiasm you want from your your customers unless it's somebody that's chomping at the bit that has requested it and that you can just ease ease them into it and say, "Look, it's not ready, but just just test it this way.
**Method Junction:** Thanks for the feedback. Um that's really important to to learn and hear from you. Um like another thing I wanted to note is you know how Barbara mentioned that you can see committed expected available the user won't be able to see that today either like that means that the when the user goes to this screen and they want to compute how much they have available it's has to be like either from their head or they have to keep their own bookkeeping somewhere else to actually compute okay this is how much I have on sales orders this is how much I have on purchase orders this is how much I actually can sell because Yeah.

## 00:31:51

**Paulette Dreher:** So J just think about your explanation, right? It just doesn't um it's not workable. It's if you, you know, one of your internal testers, it's like, yeah, this is what you have to figure out in your head. Go find me the bugs. That works. But for externally, I I wouldn't do it.
**Method Junction:** Okay. Yeah. And this kind of also translates to um just like uh locations at as well. Um right now eventually we are going to provide the ability to unlink locations from items. Uh because right now um you can link as many locations as you want but you can't unlink them. So that's kind of a friction there. You can there's also no validations in play yet. So meaning a user can go in and create the same location as many times as they want with the same address as many times as they and then link that same location as many times as they want and
**Paulette Dreher:** Ah yeah.

**Method Junction:** you can't unlink it yet.

## 00:32:53

**Method Junction:** So there are some uh some nuances with what we what we could ship uh that could add friction for the user or frustration. So just wanted to bring these up because these will be resolved in the future. It's just not today.
**Paulette Dreher:** So for the best outcome, I would say that again, if you have a particular client in mind and and you know, go for it. But otherwise, it's the holidays now. Nobody really cares because it you're what you're showing here is not quite ready for prime time. So wait like release it in you know like February or end of January when people are kind of like back in the work mode and then that gives you guys that much more time to to kind of bring it together because all your ideas, everything you've showed me is perfect.
**Method Junction:** All
**Paulette Dreher:** But yeah, in my opinion, you have to it's not something that you can release peacemeal with workarounds because it's a big deal.
**Method Junction:** right.
**Paulette Dreher:** Um, and it I think you're going to have it's going to be very successful, but a lot of people just can't visualize.

## 00:34:13

**Paulette Dreher:** I mean, we run into this all the time. like we'll talk to somebody and my uh my method developer and I like yeah we know what we're talking about and we're trying to present it and the client can't can't get it and I have to do like flowcharts or whatever because they they're more of a visual person rather than you know that they can conceptually understand what we're trying what we want to create for them. And then when we create it, it's like, oh, this is great. And so that's my two cents on, you know, releasing this and being successful. I would wait.
**Method Junction:** Okay. All right. Thanks for the feedback.
**Paulette Dreher:** Probably not what you wanted to hear. I'm sorry.
**Method Junction:** Oh, no, no, it's okay. We're open to any type of feedback. It's the It's just best to get, you know, opinion so we we make the best decision. So, this was this was very useful. Yeah. This this is what we wanted to get out of the session to be honest.

## 00:35:15

**Method Junction:** Yeah.
**Paulette Dreher:** Good. And if you do want me to test it this way, I'll do it for you. Okay. And and I'll I'll give you more feedback. But um yeah, that's that's pretty it.
**Method Junction:** Thank you so much.
**Paulette Dreher:** You're welcome. Thank you.
**Method Junction:** Yeah, you're good. Yeah, I think uh we're good on our side, Paul. We wanted to showcase everything we we built and what we're building for. And uh anything else you want to tell us or share any other feedback?
**Paulette Dreher:** No, I think you're definitely on the right track. U 100% on the right track. Sounds like, you know, you both know what you're doing. uh which sometimes I mean it sounds silly but you know a lot of times um and I've worked with programmers developers my whole career and uh sometimes they get tunnel vision and they just forget something that from the users perspective uh is so obvious but they don't see it and I I I'm not hearing that from you guys. Okay. everything you've showed me, you've you've considered like the whole spectrum.
**Method Junction:** Thank you so much.
**Paulette Dreher:** So So good.
**Method Junction:** Thank you so much. That's very encouraging to hear. Yeah, appreciate that.
**Paulette Dreher:** Tell Paul that I said you you're doing a good job. Okay.
**Method Junction:** Thank you so much. Well, yeah, that's everything, Paul. Uh we don't want to take much more of your time, but really appreciate your feedback and uh we'll stay in touch for sure.
**Paulette Dreher:** All right. Sounds good. And happy holidays, guys.
