RFC - Close Pop Up and Open Pop Up action sets configuration

Owner	Sales Management	**Status**	Draft
Last Modified by	@Nirmith Victor D'Almeida	**To be reviewed by**	**Sales Management &** @Alexander Ballard

Summary

This document outlines how we handle opening screens as pop-ups, passing data back when they close, and standardizing the format of returned data.

Motivation

The goal is to simplify transferring model data between two actions on different screens using a payload.

Purpose of the actions

- Open Screen as Pop-Up : Open the modal with the screen we choose to configure as our modal, we can also pass in a screen active record ID should they want to edit or update the values.
- Close Screen as Pop-Up: Dismiss the Pop-up and return record id of data created or record id of data updated.

Canary Releases

Action sets have no formal release pattern or restrictions. We will release these changes to all accounts and accounting software.

Rollback Strategy

To roll back, we would add a check in **editor.js** to detect the account type (e.g., internal accounts like *m11* or *m18*) and re-enable the feature only for them.

Rollback Limitation

Rolling back action sets will disable existing buttons using them and may make the Action Editor inaccessible for users.

Out of Scope

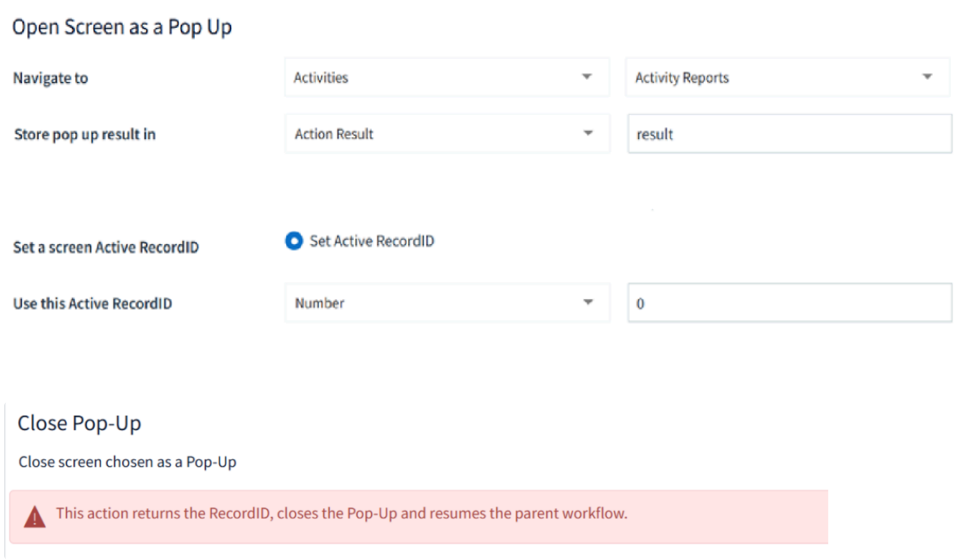
- Returning dynamic data from modals (for MVP, only the record ID will be returned).
- Defining what content types modals/pop-ups can render.

Proposed Solutions

Proposal 1: Structured JSON Payload

Summary: Return a fixed `recordID` and `status` in JSON from the Close Pop-Up action.

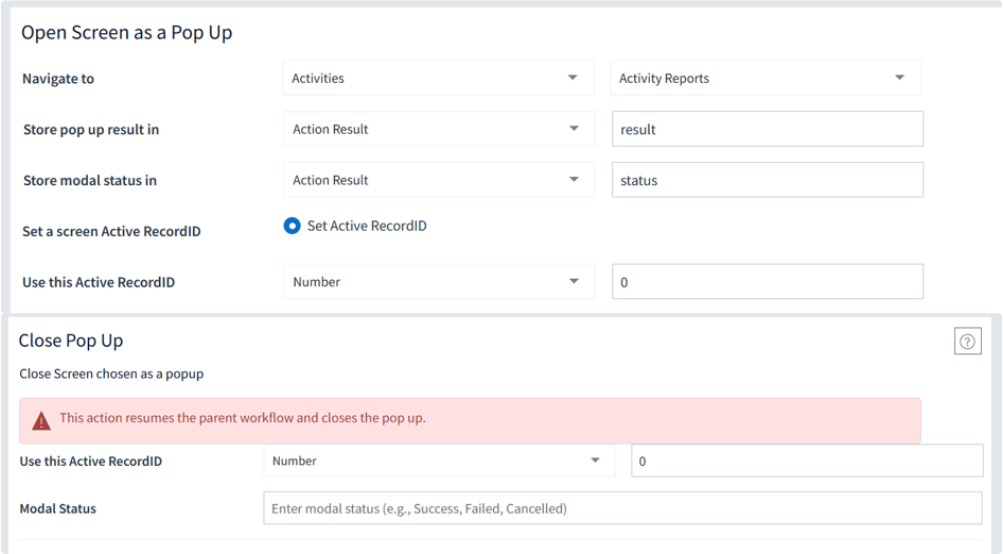
- **Benefits**:
  - Simple to configure.
  - Backend-only logic.
  - Returns consistent, predictable values.
- **Drawbacks**:
  - Requires extra actions to parse and filter JSON.
  - Increases workflow complexity.
  - With the status being set to true it will be difficult to manage the intended customizers flow
- Rough Markup for the Close Pop Up and Open Pop Up action Sets



Proposal 2: Input Fields in Action Sets

Summary: Allow configurable input fields in the Close Pop-Up action to pass values dynamically back to the parent screen.

- **Benefits**:
  - More flexible—supports multiple return values.
  - Scales well if we later support N number of return values.
  - Better user experience for cases requiring custom values.
  - With setting status we can easily proceed and continue flow based on the customizers flow
- **Drawbacks**:
  - Added complexity vs. fixed JSON approach.
  - Requires careful handling of structured vs. dynamic data.
- Rough Markup for the Close Pop Up and Open Pop Up action Sets



Timeline for completion

- Implementation is created and completed at time of document creation following Solution 2
- **Reasoning** (Please also refer this document Aug 20, 2025 https://docs.google.com/document/d/1chcch6x5J7ug2qzDIaaMnB4HfeUD07kwvcPB3ENGbjs/edit?tab=t.0#heading=h.qmck5jj6sayu Connect your Google account to get a better context on this implementation decision)
  - give our customizers more freedom to proceed with the parent action flow once the modal screen is dismissed
  - Also provide for more dynamic type of output to be returned → making it a little more powerful
