Epic 1: Add/Edit Locations and Quantities

🎯 **Problem Statment**

Customers cannot reliably fulfill orders across multiple storage locations because our current system lacks native multi-warehouse management. This gap forces users into error-prone workarounds and costly customizations that can lead to oversells, mis-sourced orders, delayed fulfillment, and ultimately churn.

Problem Space

Background & Rationale

Businesses struggle to fulfill orders accurately when inventory is scattered across multiple sites, leading to errors, delays, and customer dissatisfaction due to the lack of native multi-warehouse visibility.

By embedding native multi-warehouse support, we eliminate fragile manual workarounds and give teams confidence with available inventory data. This visibility lets businesses respond promptly to changes in demand and mitigate the risks of excess or insufficient stock, while ensuring every team sees the right information.

How do we know this is a real problem & worth solving?

We know this is a real problem because 32 accounts have requested native multi-warehouse management; without it, they resort to customizations to complete there JTBD. However, these costly workarounds are a primary churn driver, as users jump to competitors offering native multi-warehouse tracking out of the box. Moreover, our Partners and PS team repeatedly tell us that supporting inventory across more than one location isn't just a "nice-to-have"—it's foundational to how MWDs run their businesses.

Cancellation Reasons

Customers frequently cite the lack of support for multiple inventory locations and the need for a full end-to-end process that includes advanced inventory tracking.

> - “Method does not work with advanced inventory and that is very inconvenient for us.”
> - “Need more inventory management features.”
> - “We need a full end to end process for Opportunities > Sales Orders > Purchase Orders > Work Orders > Inventory Tracking by Location > Shipping Releases > Invoicing, etc. “
> - “You don't support multiple inventory locations.”

The requirement for extensive, billable customizations to perform what should be standard tasks is a frequent reason for customer departure.

> - “Your initial functionality is too basic then you want to charge me 100s of $s for things that should automatically be available as a feature.”
> - “Was fixing to buy you guys like $600+ for basic stuff that SOS inventory software does automatically.”
> - “Customization, training, and onboarding with Cin7 is a one-time charge of $800.”

By delivering true multi-warehouse management—a top feature request that eliminates customizations and addresses data-accuracy pain points—we solve the operational headaches and churn drivers our customers face, making this feature functionality a foundational requirement for MWD business retention and growth.

Who are we building for?

We are building for small (1–100 employee) B2B distribution companies that sell non-regulated, non-perishable, and non-serialized finished goods with moderate SKU complexity (1000–5000 SKUs total) across 1–3 warehouses.

Goals

1. **Inventory Accuracy Across Locations:** Enable businesses to confidently track where inventory resides — across multiple warehouses — to avoid overselling or order errors.
2. **Empower Sales & Fulfilment:** Enable faster decision-making and reduce errors by keeping users aligned on accurate, up-to-date inventory data at key stages in their workflow.

3. **Reduce Churn & Improve Competitive Positioning:** Increase Method's value proposition as a viable all-in-one solution for SMBs in our core ICP.
4. **Foundation for Advanced Workflows:** Provide a scalable core inventory infrastructure that can integrate with Katana for businesses that outgrow in-house capabilities.

Solution Space

Deliver a 3-part solution to provide native multi-warehouse support directly within Method:

1. Define & manage multiple warehouses per inventory part item
2. Update on-hand quantities per warehouse
3. Select warehouses for each transaction line item in Sales Orders, Invoices, Sales Receipts and Purchase Orders

Success Metrics

Category	Metric	Rationale
Adoption	15% of Wholesale & Distribution accounts have 2 or more active locations on day 30 post-general availability.	Captures initial feature adoption and setup; confirms real interest in using multi-warehouse functionality.
Business Impact	15% of Wholesale & Distribution accounts have fulfilled core transactions (partially or fully delivered/received) involving more than one unique location within the last 30 days.	Shows meaningful operational use — indicates the feature is solving real inventory allocation or fulfillment needs.

Functional Requirements

Below are the functional requirements (in-scope) that describe how the experience must look like from a user's perspective.

Designs

FR 1: Toggle & Access Control (Foundation) (Figma)

ID	User Story	Acceptance Criteria

FR-900	As a System Admin, I want to enable or disable multi-location management at the account level through a toggle in display, so that the feature can be safely tested before general release.	1. **Placement of Toggle** • **Given** I on an m11 or M18 account and have access to Display in Account Settings • **When** I navigate to the Display section • **Then** I see a new “Location Management” card with a toggle (On/Off) (refer to designs) 2. **Show/Hide Behaviour** • **Given** the toggle is set to *Off* • **When** I navigate to Items screens where MLM exists (these are draft screens) • **Then** all location-related functionality are hidden (schema still exists in the backend). • **Given** the toggle is set to *On* • **When** I navigate to Items screens where MLM exists (these are draft screens) • **Then** location-related functionality are visible and usable.
FR-901	As an account admin, I want to manage which users can view or manage warehouses, So that only authorized team members can create, edit, or delete warehouse records while others can still perform related tasks like viewing inventory or creating transactions.	**1. Reuse of Existing Permissions Layer** • **Given** a user has access to the Items, Sales Orders, Invoices, Purchase Orders, and/or Sales Receipts apps based on existing stock app permissions • **When** the user accesses these apps • **Then** their access to location-related functionality (e.g., viewing, selecting, or creating locations) is determined by the same app permissions • **And** location management actions within each app respect the user's assigned permission level (e.g., view-only vs. edit) **2. Conditional Visibility of "Manage Locations" CTA** • **Given** a user does not have "Manage" permissions for the Items app • **When** that user loads the Items app

		• **Then** the "Manage Locations" button is hidden from view

FR 2: Warehouse Dashboard & Management [(Figma)]

As an inventory manager, I need a dedicated Warehouse Dashboard to view, create, edit, and manage all warehouse details in one centralized location.

ID	User Story	Acceptance Criteria
FR-112	As a user, I want to access a dedicated Warehouse Dashboard screen, so that I can view, create, edit, and manage all warehouse details in one place.	1. **Accessing the Dashboard** • **Given** I am in the “Items List” screen • **When** I click “Manage Warehouses” button next to the “Add a New Item” button • **Then** I am taken to the Warehouse Dashboard screen (refer to designs). 2. **Default Primary Location Display** • **Given** I have not created any custom warehouses in my account • **When** I navigate to the Warehouse Dashboard screen • **Then** the table displays a single row for the Primary Location (default) warehouse with only the Name column filled in with “Primary Location” • **And** columns Legal Name and Address are empty till defined. 3. **View All Warehouses** • **Given** I am on the Warehouse Dashboard screen • **When** the page finishes loading • **Then** I see a table listing all active warehouses with columns: Name, Legal Name, Address
FR-113	As a user, I want to add a new warehouse from the Warehouse Dashboard screen, so that I can create and manage all warehouse details in one place.	1. **Add New Warehouse** • **Given** I’m in the Warehouse Dashboard screen • **When** I click “Add New Warehouse” button • **Then** a “Add New Warehouse” modal opens with required fields: Location Name, Legal Name, and

		Address fields. (refer to designs) 2. **Populate Warehouse Table from Modal Input (All Rows After First Entry)** • **Given** all fields in “Add New Warehouse” modal have valid input • **When** I click the Save & Close button • **Then** the modal closes and a new row appears in the Warehouse table below previous warehouse row • **And** includes the warehouse Location Name, Legal Name, and Address 3. **Persist Newly Created Warehouse** • **Given** I have created a new warehouse via the “Add New Warehouse” modal from the Warehouse Dashboard screen or “New / Edit Inventory Part” item screen • **When** I reopen or reload the Warehouse Dashboard screen • **Then** the newly created warehouse is persisted and remains in the table
FR-114	As a user, I want to edit an existing warehouse’s details from the Warehouse Dashboard so that I can update its Location Name, Legal Name, and Address—and have those changes flow through all linked transactions.	1. **Navigate to Edit Warehouse Screen** • **Given** I am on the Warehouse Dashboard screen with • **When** I click any warehouse row • **Then** I am redirected to the Edit Warehouse screen for that warehouse. (refer to designs) 2. **Update Fields and Save** • **Given** I am on the Edit Warehouse screen displaying Location Name, Legal Name, and Address fields pre-filled • **When** I modify one or more of these fields and click the Save & Back button • **Then** I am redirected back to the warehouse dashboard that now reflects the updated fields for

		that warehouse. • **And** when I reopen or reload the Warehouse Dashboard screen the warehouse row continues to display the updated fields. 3. **Propagate Updates to All Linked Transactions, Item Screens & Stock Adjustments** • **Given** the warehouse details have been updated and saved • **When** I view any existing Sales Order, Invoice, Purchase Order, or Sales Receipt that is sourced or shipped to this warehouse, any inventory part items linked to this warehouse, and any stock adjustment associated with this warehouse • **Then** those transactions and items display the new Location Name, Legal Name, and Address wherever the warehouse is referenced (where applicable). 4. **Cancel Discards Changes** • **Given** I am on the Edit Warehouse screen and have modified one or more fields but have not clicked Save & back • **When** I click Back, navigate away or refresh the screen • **Then** no changes are saved and all fields revert to their last persisted values on the Edit screen, on the Warehouse Dashboard, and everywhere the warehouse is currently referenced in transactions and items.
FR-121	As an user, I want the system to prevent duplicate warehouse information anywhere they can be created or renamed, so that locations remain uniquely identifiable across items and transactions.	1. **Global uniqueness (create from Warehouse Dashboard)** • **Given** I am creating a new warehouse (from the Warehouse Dashboard or Item screen) or renaming an existing warehouse (Edit Location screen)

		• **When** the Location Name, Legal Name, or Address matches an existing warehouse in my account (active or inactive)
		• **Then** the save is blocked and an error message appears, specifying which field is duplicated:
		  ◦ "A warehouse with this Location Name already exists. Location Names must be unique. Choose a different name."
		  ◦ "A warehouse with this Legal Name already exists. Legal Names must be unique. Choose a different name."
		  ◦ "A warehouse with this Address already exists. Addresses must be unique. Choose a different Address."
		• **And** display an error message for combination duplicates for ex:
		  ◦ "A warehouse with this Location Name and Legal Name already exists. Location Names and Legal Names must be unique. Choose a different name."

FR 3: Item-Warehouse Linking [(Figma)]

As a user, I need to define and manage multiple warehouses per inventory part item to track stock separately for each location.

ID	User Story	Acceptance Criteria
FR-100	As a user, I want to define and manage multiple warehouses per inventory part item so that I can track stock separately for each location.	1. **Warehouse Section Display** • **Given** I create or view an existing inventory part item • **When** the "New / Edit Inventory Part" item screen loads • **Then** I see a warehouse creation and selection section located near the bottom of the screen (refer to designs)

		2. **Default Warehouse Table State for New Item Creations** • **Given** I am creating a new item on a “New / Edit Inventory Part” item screen viewing the Warehouse table • **When** the table initially renders • **Then** the first row in the warehouse table displays the linked default warehouse dropdown in the Warehouse name column • **And** if no other warehouses exist in the system, the dropdown is empty if clicked • **And** if there are warehouses not yet linked to this item, the dropdown lists all existing warehouses the user can choose from to populate the first warehouse row. (refer to designs)
FR-102	As a user, I want to create new warehouses from the “New / Edit Inventory Part” item screen, so that I can immediately begin tracking location of my items.	1. **Add New Warehouse** • **Given** I’m in the “New / Edit Inventory Part” item screen • **When** I click Add New Warehouse button in the warehouse section • **Then** a “Add New Warehouse” modal opens with required fields: Location Name, Legal Name, and Address fields. (refer to designs) 2. **Populate Warehouse Table from Modal Input (All Rows After First Entry)** • **Given** all fields in “Add New Warehouse” modal have valid input • **When** I click the Save & Close button • **Then** the modal closes and a new row appears in the Warehouse table below previous warehouse row • **And** includes the warehouse Location Name, empty QTY field. 3. **Persist Newly Created Warehouse**

		• **Given** I have created a new warehouse via the "Add New Warehouse" modal on the "New / Edit Inventory Part" screen • **When** I reopen or reload the item screen • **Then** the newly created warehouse is persisted and remains in the table
FR-103	As a user, I want to add existing warehouses to an item, so that I can track stock separately in locations I've already defined.	1. **Update Default Warehouse Row with an Existing Warehouse** • **Given** I'm on a "New / Edit Inventory Part" item screen viewing the warehouses table and it shows the linked default warehouse dropdown • **When** I click that dropdown and choose "Warehouse A" from the list of all existing warehouses • **Then** the first row's Warehouse Name is set to "Warehouse A" and has empty QTY field. 2. **Add Existing Warehouse Row (All Rows After First Entry)** • **Given** I'm on a "New / Edit Inventory Part" item screen viewing the Warehouses table • **When** I click "Add Existing Warehouse" button • **Then** a new blank row appears after previous warehouse rows with a dropdown "Select Warehouse" of all existing warehouses in the Warehouse Name column. (refer to designs). 3. **Select Non-Duplicate Warehouses** • **Given** the "Select Warehouse" dropdown is open • **When** I select a warehouse (e.g., Warehouse A) from the list • **Then** the row's Warehouse Name becomes "Warehouse A" and has empty QTY fields. 4. **Prevent Duplicates** • **Given** "Warehouse A" is already linked to this inventory part item

		• **When** I click “Add Existing Warehouse”, and choose “Warehouse A” from the “Select Warehouse” dropdown in the new row • **Then** a show message immediately appears and says “Warehouse A is already linked to this inventory part item. Please choose an unlinked warehouse if you wish to proceed” • **And** the row returns to the “Select Warehouse” dropdown state. 5. **Persist Linked Warehouses on Save** • **Given** I have linked one or more existing warehouses • **When** I click the save button • **Then** the new warehouse links are saved • **And** when I reopen or reload the item screen, the linked warehouses appear in the table 6. **Discard Unsaved Warehouse Additions** • **Given** I have added one or more existing warehouses in the Warehouses table but have not clicked save on the item screen • **When** I close the window, navigate away, or reload the screen • **Then** any unsaved warehouse rows are discarded and the table reverts to the last saved state.
FR-104	As a user, I want to remove any empty “Add Existing Warehouse” rows so that my Warehouses table stays clean and only shows meaningful entries.	1. **Remove Blank Row on Click** • **Given** I have one or more blank rows in the Warehouses table created by clicking “Add Existing Warehouse” button • **When** I click the delete (trash) icon on a blank row in the “New / Edit Inventory Part” item screen • **Then** that row is immediately removed from the table. 2. **No Persistence of Blank Rows** • **Given** there are blank rows in the table

		• **When** I click save buttons • **Then** the table persists only the non-blank warehouse links and all blank rows are automatically deleted. 3. **Revert on Reload for Unsaved Blanks** • **Given** I have added a blank row but not clicked the delete icon or Save • **When** I reload or navigate away and return to the Item screen • **Then** the blank row does not reappear, showing only previously saved links.

FR 4: Stock Adjustment Workflow [(Figma)]

ID	User Story	Acceptance Criteria
FR-105 NEW	As a user, when creating a new inventory part item I want to manually enter the item's initial stock and have the system validate it against the sum of all warehouse quantities on save so that I can ensure my overall stock level remains consistent.	1. **Initial Stock "Quantity in Stock" is Editable Upon Item Creation** • **Given** I am on a "New / Edit Inventory Part" item screen creating a new item • **When** I view the total "Quantity in Stock" field • **Then** the field is editable and accepts a numeric value just like it does today. 2. **Persist Total After Save** • **Given** I have entered a valid total "Quantity in Stock" and QTY's for all warehouses • **When** I click the save button on the item screen and the active warehouse QTYs sum to the entered total • **Then** the item saves successfully and the manually entered QTY's are persisted • **And** when I reopen or reload the item screen, the total "Quantity in Stock" field and each warehouse's QTY displays the last saved values. 3. **Validate on Save – Match**

- **Given** the sum of all linked warehouse quantities equals the total “Quantity in Stock”
- **When** I click the save button on the item screen
- **Then** the save proceeds with no warnings.

4. **Validate on Save – Mismatch**

- **Given** the sum of all linked warehouse quantities does not equal the total “Quantity in Stock”
- **When** I click the save button on the item screen
- **Then** the system prevents save and displays a show message that says “To proceed, the “Quantity in Stock” needs to match the warehouse total. Give it another look and adjust as needed”.

5. **Zero Default**

- **Given** all warehouse QTYs are zero/empty
- **When** I open the Item screen
- **Then** the total “Quantity in Stock” field defaults to “0.00”.

6. **Discard Item Creation**

- **Given** I have modified the total “Quantity in Stock” or warehouse QTYs, or any other field without saving upon Item creation flow
- **When** I navigate away, close the window, or reload
- **Then** the item is not saved and cannot be accessed from the items table.

7. **Non-Editable Quantity Fields After Creation**

- **Given** I have successfully created and saved a new inventory part item
- **When** I return or reload that new items “New / Edit Inventory Part” item screen
- **Then** the “Quantity in Stock” and Location Quantity fields are non-editable and cannot be updated directly anymore.

		• **And** I see a new button called “Adjust Stock” next to “Save & Back” button.
FR-106 NEW	As a user, I want to update item quantities at a specific location through a stock adjustment modal, so that my inventory remains accurate without directly editing location quantities.	1. **“Adjust Stock” Button Appears After Creation** • **Given** a new inventory part item was created in Method or synced from QBO • **When** I view the “New / Edit Inventory Part” item screen for that item • **Then** the “Adjust Stock” button appears next to “Save & Back” button and is usable. • **And** the “Adjust Button” does not appear when creating a new inventory part item, only after creation. 2. **Triggering the Stock Adjustment Modal** • **Given** I am on the “New / Edit Inventory Part” item screen • **When** I click the "Adjust Stock" button next to "Save & Back" • **Then** a Stock Adjustment modal opens above the Item screen • **And** the modal contains required fields: “Reason for Adjustment”, “Date”, “Location”, “Location Quantity on Hand”, and “Adjustment +/-”. 3. **Location Quantity Population** • **Given** the Stock Adjustment modal is open • **When** I click the “Location” dropdown • **Then** it shows me all active locations currently on this account • **And** when I choose a location the "Location Quantity on Hand" field auto-populates with the current quantity of this item in that location and is displayed as read-only. 4. **Adjustment Entry** • **Given** I have selected a location in the Stock Adjustment modal

		• **When** I enter a positive number in the "Adjustment +/-" field
		• **Then** the system will increase the quantity in that location by that amount.
		• **And** if it's a negative number then it will decrease the quantity in that location by said amount.
		5. **Saving and Applying the Adjustment**
		• **Given** all fields in Stock Adjustment modal have valid input
		• **When** I click the Save & Close button
		• **Then** the modal closes and the Item screen refreshes, showing:
		  ◦ The updated location quantity if already linked
		  ◦ Adds a new location to the location row with adjusted quantity if not linked
		  ◦ The "Quantity in Stock" field updates to reflect the sum of all location quantities.
		• **And** when I reopen or reload the item screen, each impacted location quantity and "Quantity in Stock" displays the adjusted values.

FR-122 NEW	As a user, I want to view a centralized log of all stock adjustments, so that I can track historical changes to item quantities across all locations in one place.	1. **Stock Adjustment Log Access** • **Given** I am on the "Items List" screen • **When** I view the screen • **Then** I see a new tab labeled "Adjusted Stock" next to "All Items." 2. **Viewing the Log** • **Given** I am on the "Items List" screen • **When** I click on the "Adjusted Stock" tab • **Then** I am navigated to a table of all stock adjustments with the following columns: Date, Item, Details, and Reason for Adjustment. 3. **Empty State** • **Given** there have been no stock adjustments • **When** I view the "Adjusted Stock" tab

		• **Then** the table displays as empty.
		4. **Populated State**
		• **Given** stock adjustments have been made
		• **When** I view the “Adjusted Stock” tab
		• **Then** the table displays one row per adjustment with:
		  ◦ The Date entered from the modal
		  ◦ The Item adjusted
		  ◦ The Reason for Adjustment entered from the modal
		  ◦ The Details in the format: *“Quantity adjusted from X to Y in Location Z.”*

FR 5: Decoupled Inventory Management from QBO

ID	User Story	Acceptance Criteria
FR-123 NEW	As a user, I want “Quantity in Stock” to be decoupled from QBO Quantity on Hand, so that inventory levels in Method remain under Method’s control and are not impacted by item or transaction updates from QBO.	1. **QBO Item Updates** • **Given** I update an item’s Quantity on Hand in QBO • **When** the change syncs into Method • **Then** Method QoH does not update. 2. **QBO Transaction Creation/Updates** • **Given** I create/update a transaction (Invoice, Sales Receipt, Purchase Order, Bills) in QBO that changes quantities • **When** the transaction syncs into Method • **Then** Method QoH, committed, and expected quantities remains unchanged. 3. **No Relation Between the Two** • **Given** Method QoH is decoupled from QBO • **When** I perform inventory adjustments or inventory impacting transactions within Method • **Then** only Method QoH, committed, and expected quantities is updated, independent of

		QBO QoH.
FR-124 NEW	As a user, I want new inventory part items created in QBO to sync into Method with Method QoH and default location automatically assigned, so that I can begin tracking stock right away.	1. **Sync New QBO Items With QoH** • **Given** a new inventory part item is created in QBO with a QBO QoH • **When** it syncs into Method • **Then** the item appears in Method with Method QoH = QBO QoH • **And** the default location assigned to the item with location quantity = QBO QoH • **And** both the Method QoH and Location quantity fields are non-editable • **And** the "Adjust Stock" button is available to use for stock adjustments.
FR-125 NEW	As a user with Inventory Management enabled, I want Method to always track inventory changes from transactions created or updated in Method, but ignore QBO changes for finalized transactions, so that QuickBooks updates don't overwrite Method's inventory quantities.	1. **Default flag behaviour** • **Given** I enable Multi-Location Management toggle from display settings on my Method account • **When** a new or existing Sales Order or Purchase Order is created or opened in Method • **Then** the Wait for Sync Approval flag is checked by default. 2. **Inventory Ignored Once Synced to QBO (Sync Approval Unchecked)** • **Given** a transaction has synced to QBO (i.e., it has a QBO Transaction ID or the "Wait for Sync Approval" flag is unchecked) • **When** changes are made to that transaction in QBO • **Then** Method QoH, expected, and committed stock remain unchanged, but the changes made do reflect in the transaction in Method. 3. **Inventory Tracking With Sync Approval Checked**

		• **Given** the “Wait for Sync Approval” flag is checked on a transaction (SO, PO) • **When** I create or update the transaction in Method • **Then** Method’s inventory calculations for QoH, expected, and committed stock are updated accordingly • **And** are always tracked no matter if the flag is checked or unchecked. 4. **Sales Orders Always Impact Inventory** • **Given** Sales Orders do not sync with QBO • **When** I create or update a Sales Order in Method • **Then** the “Wait for Sync Approval” flag is always checked, and the transaction always impacts Method’s inventory calculations. 5. **REST API guardrail** • **Given** a transaction has a QBO Transaction ID • **When** an update is made via Method’s REST API • **Then** inventory calculations are not triggered, since the transaction is considered finalized. 6. **Inventory vs. Accounting precedence** • **Given** a transaction has already been synced to QBO (flag unchecked or QBO Transaction ID present) • **Then** it is treated as a finalized transaction from an inventory perspective, and accounting changes take precedence (no recalculation of inventory unless changes were made in Method).

FR 6: Migration for New/Existing Users

ID	User Story	Acceptance Criteria
FR-700 NEW	As a new user syncing inventory part items and transactions from QBO for the	1. **Match Items with QBO QoH to Method QoH**

	first time, I want my items' QBO QoH to initialize Method QoH and be assigned to the default warehouse, while synced transactions remain without a location assignment, so that I can begin tracking stock in Method right away without misrepresenting past data.	• **Given** I am a new Method user syncing inventory part items from QBO for the first time • **When** the items sync into Method • **Then** the system automatically matches every inventory part item and its current QBO QoH to the default location and Method QoH. • **And** the location quantities equal the Method QoH • **And** both the Method QoH and Location quantity fields are non-editable • **And** the "Adjust Stock" button is available to use for stock adjustments. 2. **Do Not Assign Location to Synced Transactions** • **Given** I am a new Method user syncing transactions (Invoices, Purchase Orders, Sales Receipts) from QBO for the first time • **When** the transactions sync into Method • **Then** they are created in Method without a location assigned, with the Location field left blank
FR-701 NEW	As a current stock user with existing inventory part items and transactions, I want my items' QBO QoH to automatically match Method QoH and be assigned to the default warehouse, while my historical transactions remain without a location assignment, so that I can begin tracking stock immediately without misrepresenting past data.	1. **Automatic Warehouse for Eligible Accounts** • **Given** I have stock screens across the affected screens • **When** the multi-location experience is released • **Then** the system automatically links every inventory part item and its current QBO QoH to the default location and Method QoH. • **And** the location quantities equal the Method QoH • **And** both the Method QoH and Location quantity fields are non-editable • **And** the "Adjust Stock" button is available to use for stock adjustments. 2. **Do Not Auto-Assign Locations to Transactions**

		• **Given** I have open or closed transactions (Invoices, Sales Orders, Purchase Orders, and Sales Receipts) created before MLM was enabled • **When** MLM is turned on for the first time • **Then** those transactions remain without a location assignment, with the Location field left blank.

FR 7: Bulk Import & Export for Warehouse and Stock

ID	User Story	Acceptance Criteria
FR-800	As a user, I want to import and export locations and stock data in bulk, So that I can quickly set up or update inventory records without editing each one manually.	**1. Export Existing Inventory Data with Location Linkage** • **Given** I have inventory part items linked to a default or custom location • **When** I export my inventory data • **Then** the exported file includes each inventory part items associated locations(s), location on-hand quantity, address, and Total Method QoH field. **2. Update Warehouse Data via Import** • **Given** I have exported my inventory and made changes to my inventory data • **When** I reimport the updated file • **Then** the system updates the corresponding inventory records to reflect the changes (e.g., moved stock, new default location, updated address, new links, updates to location quantity on hand and Method QoH) **3. Use Existing Import Infrastructure** • **Given** I am importing inventory-related data • **When** I use the existing import tool • **Then** I can select or upload a file mapped to the correct table **4. Field Mapping and Validation** • **Given** I upload a CSV using the import tool

		• **When** the system processes the file • **Then** it automatically maps fields to known database fields • **And** alerts me to any required fields missing or invalid data before import completes

Non-Functional Requirements

The following non-functional requirements outline performance, reliability & integrity, security, responsiveness, and accessibility for this new experience.

Category	Requirement
Performance	• Warehouse selection and stock calculations must complete in **< 500ms** for standard transactions with ≤ 50 lines. • Quantity changes (On Hand, Committed, Expected, Available) should reflect in the UI once refreshed after a stock-affecting event. • Loading a transaction with multiple warehouses should not add more than **200ms** to baseline load times. • Support up to **100 warehouses** without performance degradation.
Reliability & Integrity	• Stock totals must be accurate across all warehouses with no duplicate adjustments during migration, sync, or transaction processing. • Changes to warehouse status (active/inactive) must not alter historical transaction data.
Security	• All warehouse actions must respect the current inventory permissions model
Responsiveness	• Must function on desktop/tablet/mobile
Accessibility	• Color contrast and focus states must comply with WCAG 2.1 AA standards

Out of Scope

The following items **will not** be addressed in this sprint to keep the experience focused and deliverable:

- Bin Level Management (Part of our next sprint “Available Inventory Visibility”)
- Stock Adjustments
- Warehouse Tax
- Warehouse Level Permissions
- Multi-Tenancy Warehouse Sharing
