Epic 2: Quantity on Hand Business Rules & Transaction Enforcement

📖 Functional Requirements

FR 1: Sales Order and Invoice Source Management

As a user, I need to choose source locations for inventory items on Sales Orders with real-time availability validation.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-200 FINAL	DESIGN DESIGN DESIGN	As a user, I want to choose a source location for each inventory part item on a Sales Order, and Invoice, for accurate location reporting.	1. **Show "Source Location" Dropdown** • **Given** I am creating or editing a Sales Order or Invoice on the "New / Edit Sales Order" and or "New / Edit Invoice" screen • **When** the screen loads • **Then** I see the Items table with a new "Source Location", "Available Qty" and "Inventory" columns (refer to designs) 2. **List Only Linked Active Locations** • **Given** I have added an inventory part item • **When** I click the "Select Location" dropdown for that line item • **Then** it lists only the active locations currently linked to that item • **And** when I click on a location, the "Available Qty" field populates with the available quantity of stock at a location level (Quantity in Stock in Location - Committed stock in Location + Expected Stock in Location) that is available to sell for that item. (refer to designs) 3. **Persist Selection**

	DESIGN DESIGN		• **Given** I have selected a source location with sufficient available stock for one or more inventory part items • **When** I save the Sales Order and Invoice • **Then** each line's chosen location and quantity are persisted in the order record • **And** those selections remain unchanged when I reopen or reload the Sales Order and Invoice 4. **Error on Invalid Selection** • **Given** I attempt to save the Sales Order or Invoice with a inventory part item that has no location selected • **When** I click the save buttons • **Then** the order is not saved, and a show message appears that says "Please select a source location for XYZ" and should mention which items requires a selection. 5. **View Overview of Available Stock** • **Given** I have added an inventory part item and the row populates with "Select Location" dropdown under Source Location columns and "View All" button under Inventory column • **When** I click the "View All" button • **Then** a modal appears that provides the total available stock across linked active locations and breakdown by linked active locations.
FR-202 FINAL	DESIGN	As a user, I want the "Select Location" dropdown to show one option for service and non-inventory part items so that I can save Sales Orders, Invoices without location-related errors.	1. **Only Not Applicable for Non-Stock Items** • **Given** I have added a service or non-inventory part item to a Sales Order, Invoice item table • **When** the line renders • **Then** the "Select Location" dropdown only shows "Not Applicable" as the only option

			• **And** the “View All” button when clicked shows a show message that says “Service and Non-Inventory part items are not tied a location and do not have stock associated with them”. 2. **Normal Save Behaviour** • **Given** the Sales Order, Invoice contains service and/or non-inventory part items (with Not Applicable fields chosen) • **When** I click the save buttons • **Then** the order saves successfully with no location-related validation errors or warnings.
FR-204 FINAL @b.stevenson	DESIGN BACKEND	As a user, I want the system to allow committing more stock than is currently available when creating Sales Orders, so that I can still capture sales demand even if stock is short, while seeing clear visibility into shortages.	1. **Allow Over-Commit on Save** • **Given** I have added an inventory part item to a Sales Order, added an order quantity, and selected a source location whose available stock is less than the ordered quantity • **When** I click the save button • **Then** a confirmation message appears that says: “Some locations (The hive) do not have sufficient stock available. Saving will over-commit inventory, resulting in negative available stock and preventing immediate fulfillment. Do you want to proceed?” 2. **Over-Commit Confirmation Flow** • **Given** I attempt to save a Sales Order with an ordered quantity greater than the available stock at the selected location • **When** the confirmation message appears with options Cancel and Confirm • **Then**: ◦ If Confirm is selected: ▪ The transaction is saved successfully. ▪ The full ordered quantity is committed.

			▪ Stock levels are updated as follows: • Method QoH remains unchanged until fulfillment. • Committed increases by the full ordered quantity. • Available recalculates, which will be negative in this scenario. ◦ If Cancel is selected: ▪ The transaction is not saved. ▪ The user is returned to the open transaction to adjust quantities or location.
FR-206 FINAL @b.stevenson	DESIGN DESIGN DESIGN BACK END	As a user, I want to update inventory part rows—item, order quantity, and source location—for Open and partially delivered Sales Orders (while fully delivered lines remain locked), so that I can correct or reallocate stock before final fulfillment and the system adjusts committed quantities accordingly.	1. **Edit Open Orders** • **Given** a Sales Order in open state (i.e., all line items in committed state) • **When** I view the item table • **Then** the entire table is editable • **And** when I save the Sales Order after changing Order Qty and/or Source location and/or delete the item, the system releases the previous committed amount and reserves the new amount in the selected location (updating committed stock accordingly). 2. **Edit Partially Delivered Orders** • **Given** a Sales Order with some lines delivered and others still committed • **When** I view the “Items not shipped” and “Items delivered” table • **Then** the “Items not shipped” table remains fully editable • **And** the “Items delivered” table is read-only, cannot be edited and line items cannot be deleted. 3. **Block Edits on Fully Delivered Orders**

	DESIGN		• **Given** a Sales Order is fully delivered (all line items delivered) • **When** I view the “Items delivered” table • **Then** the entire table remains not editable and line items cannot be deleted. 4. **Persist and Reflect Changes** • **Given** I have made valid edits to editable lines inside the “Items not shipped” table • **When** I click the save buttons • **Then** the sales order record persists my changes • **And** when I reopen or reload the item screen, the updated, items, Order Qty, and/or Source Location, and recalculated committed stock values are displayed correctly. 5. **Discard Unsaved Edits** • **Given** I have modified one or more editable fields within the “Items not shipped” table without saving • **When** I navigate away or reload the page • **Then** all unsaved changes are discarded and the order reverts to its last saved state.

FR 2: Purchase Order Destination Management

As a user, I need to select destination locations for Purchase Orders to track expected inventory at the correct locations.

ID	Design or Backend?	User Story	Acceptance Criteria
FR-201 FINAL	DESIGN	As a user, I want to choose a destination location for each inventory part item on a Purchase Order and Bill so	1. **Show “Destination Location” Dropdown** • **Given** I am creating or editing a Purchase Order or Bill on the “New / Edit Purchase

	DESIGN BACKEND DESIGN	that stock is allocated to the correct location.	Order" screen • **When** the screen loads • **Then** I see the Items table with a new "Receive to" and "Available Qty" and "Inventory" columns (refer to designs). 2. **List All Active Locations** • **Given** I have added an inventory part item • **When** I click the "Select Location" dropdown for that line item • **Then** it lists all active locations in the account to choose from. • **And** when I click on a location, the "Available Qty" field populates with the available quantity of stock at a location level if linked (Quantity in Stock in Location - Committed stock in Location + Expected Stock in Location) • **And** if an unlinked location is chosen then the "In Stock" field shows "0". 3. **Persist Selection** • **Given** I have selected a destination location for one or more inventory part items • **When** I save the Purchase Order • **Then** each line's chosen location and order quantity are persisted in the order record • **And** those selections remain unchanged when I reopen or reload the Purchase Order. 4. **Error on Invalid Selection** • **Given** I attempt to save the Purchase Order with a inventory part item that has no warehouse selected • **When** I click the save buttons • **Then** the order is not saved, and a show message appears that says "Please select a

			destination location for XYZ" and should mention which items requires a selection. 5. **View Overview of Available Stock** • **Given** I have added an inventory part item and the row populates with "Select Location" dropdown under Receive to columns and "View All" button under Inventory column • **When** I click the "View All" button • **Then** a modal appears that provides the total available stock across linked active locations and breakdown by linked active locations.
FR-203 FINAL	DESIGN DESIGN BACKEND BACKEND	As a user, I want non-inventory and service items to be selectable on Purchase Orders, and for their location field to be non-editable so that only stock-tracked items require a destination warehouse.	1. **Include Marked Items in PO Line-Item Dropdown** • **Given** a non-inventory part item has "Used on purchase transactions" checked • **And** a service item has "I purchase this service from a supplier" checked • **When** I click the Add Item dropdown on a new Purchase Order • **Then** those marked non-inventory and service items appear alongside inventory parts like it does today. 2. **Show Not Applicable for Marked Items** • **Given** I have added a marked non-inventory or service item to a PO line • **When** that line renders • **Then** the Receive to dropdown shows Not Applicable as the only option. 3. **Allow Edits on Other Fields** • **Given** the location field is disabled for the marked line • **When** I enter quantity, rate, or description on that line • **Then** those fields accept input as normal

	BACK END		4. **Normal Save Behaviour** • **Given** my PO contains only marked non-inventory/service lines and/or inventory part lines • **When** I click Save on the Purchase Order • **Then** the order saves successfully with no location-related errors • **And** the inventory part lines require a valid destination location as usual 5. **Persist Chosen Fields on Reload** • **Given** I have saved a PO containing marked non-inventory or service items • **When** I reopen or reload the PO • **Then** the previously chosen not applicable fields remain for those lines.
FR-110 FINAL	BACK END DESIGN BACK END	As a user, when I create a Purchase Order for an inventory part item and select a destination location that isn't yet linked to that item, I want the system to automatically link that location to the item so that future stock can be tracked there.	1. **Auto-Link on PO Save** • **Given** I have selected a destination location not yet linked to an inventory part item • **When** I click Save on the Purchase Order • **Then** the system creates a link between that item and the selected location. 2. **Persisted Warehouse Link** • **Given** the Purchase Order has been saved with the new location selection • **When** I navigate to the item's "New / Edit Inventory Part" screen • **Then** the Locations table includes a row for the newly linked locations with an empty Qty field that is non-editable. 3. **No Duplicate Links** • **Given** an inventory part item is linked to multiple locations • **When** I create another PO and select a linked location

			• **Then** saving the PO does not create a duplicate location row in the item's location table.

FR-111
 	
FINAL
	BACK END	As an user, I want the system to correctly update location links when I change the destination location in a an open purchase order so that inventory data remains accurate.	**Update Linked Locations**
			• **Given** an open purchase order with a destination location that is only referenced in this PO and not in any other transactions (sales orders, invoices, bills)
			• **When** I change that destination location for that line item to a previously linked or new location and click the save buttons
			• **Then**
			  ◦ The system unlinks the original location from the inventory part item
			  ◦ The system links the updated destination location to this item if not already linked
			  ◦ And the location quantity fields are non-editable and can be edited via stock adjustment

FR-209 FINAL @b.stevenson	DESIGN DESIGN	As a user, I want to update inventory part rows—item, order quantity, and destination location—for open and partially received Purchase Orders (while received lines remain locked), so that I can correct or reallocate stock before final delivery and the system adjusts expected quantities accordingly.	1. **Edit Un-Received Orders** • **Given** a Purchase Order in open state (i.e., all line items in expected state) • **When** I view the item table • **Then** the entire table is editable • **And** when I save the PO after changing Order Qty and/or destination location, the system releases the previous expected amount and updated the new amount in the selected location (updating expected stock accordingly). 2. **Edit Partially Received Orders** • **Given** a PO with some lines received and others still expected

	DESIGN BACK END BACK END		• **When** I view the “Items not received” and “Items received” tables • **Then** the “Items not received” table remains fully editable and line items can still be deleted • **And** the “Items received” table is read-only, cannot be edited and line items cannot be deleted. 3. **Block Edits on Fully Received Orders** • **Given** a PO is fully received (all line items received) • **When** I view the “Items received” table • **Then** the entire table remains not editable and line items cannot be deleted. ◦ The order can still be edited/updated in QBO independent of the order status in Method 4. **Persist and Reflect Changes** • **Given** I have made valid edits to editable lines inside the “Items not received” table • **When** I click the save buttons • **Then** the PO record persists my changes • **And** when I reopen or reload the item screen, the updated, items, Order Qty, and/or destination Location, and recalculated expected stock values are displayed correctly. 5. **Discard Unsaved Edits** • **Given** I have modified one or more editable fields within the “Items not received” table without saving • **When** I navigate away or reload the page • **Then** all unsaved changes are discarded and the order reverts to its last saved state.

FR 3: Sales Order Committed Stock Management

As a user, I need the system to automatically track and release committed stock throughout the Sales Order lifecycle.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-300 FINAL	DESIGN BACK END	As a user, I want the system to automatically track committed stock when I add an inventory part item to a Sales Order so that available stock reflects reserved quantities and prevents over-committing.	1. **Increment Committed on New/Updated Sales Orders Saved** • **Given** I am creating or editing a Sales Order on the "New / Edit Sales Order" screen • **When** I add an inventory part item, input an order quantity, select a source location and click the save button • **Then** the back end increases the committed value for that location item by the order line quantity. 2. **Recalculate Available Stock** • **Given** the committed and in stock values for a location item have been updated • **When** I reload, open and/or create a new Sales Order and select a new location or view the "Available Qty" field • **Then** it displays the latest available quantity in stock (Quantity in stock in Location - Committed stock in Location + Expected stock in Location)
FR-301 FINAL @b.stevenson	DESIGN	As a user, I want the system to automatically release committed stock when a user deletes an Open (i.e., all line items in committed state) Sales Order, so that available inventory remains accurate.	1. **Show Release Confirmation** • **Given** a Sales Order in open state with one or more lines reserving committed stock • **When** I click the delete button • **Then** a show message appears stating "Deleting this order will release all committed stock back to available inventory. This action

	BACK END BACK END		cannot be undone. Do you wish to continue?”. 2. **Release on Confirmed Deletion** • **Given** the show message is displayed • **When** I click confirm • **Then** each line’s committed quantity is subtracted from the linked location’s committed balance and added back to location available stock. 3. **Abort on Cancellation Dismissal** • **Given** the show message is displayed • **When** I click cancel • **Then** no changes occur to committed or available stock and the order remains unchanged.
FR-302 FINAL @b.stevenson	DESIGN DESIGN BACK END	As a user, I want deleting a partially delivered Sales Order to release the committed + delivered quantities back to linked locations available and quantity in stock, so that my inventory remains accurate and I get clear confirmation of what’s being released.	1. **Delete Option for Unlinked Sales Orders** • **Given** a partially delivered Sales Order is not linked to an existing Invoice • **When** I view the Sales Order • **Then** the delete button is available. 2. **Show Release Confirmation** • **Given** a Sales Order with delivered and committed quantities and the is not linked to an existing Invoice • **When** I click the delete button • **Then** a show message appears stating “Deleting this order will release the committed and delivered quantities back to location available stock and quantity in stock. This action cannot be undone. Do you wish to continue?”. 3. **Release on Confirmed** • **Given** the show message is displayed

	BACK END DESI GN		• **When** I click confirm • **Then** only the committed quantities are subtracted from the location's committed balance and added back to available stock. • **And** the delivered quantities are added back to the location's quantity in stock. 4. **Abort on Cancellation Dismissal** • **Given** the show message is displayed • **When** I click cancel • **Then** no changes occur to committed, available, or in stock and the order remains open. 2. **Restrict Delete for Linked Sales Orders** • **Given** a partially delivered Sales Order is linked to an existing Invoice • **When** I view the Sales Order • **Then** when I click the delete button a show message appears saying *"One or more delivered items are linked to an Invoice. To delete this order, please delete all associated Invoices first."* • **And** when the user deletes all associated invoices, then the delete button proceeds with regular flow.
FR-304 FINAL	DESI GN BACK END	As an user, I want to be able to update committed line items in open and partially delivered Sales Order, so that sourced stock reflects the correct items, quantities and locations before items are delivered.	1. **Editable Fields on Open and partially deliveredSO** • **Given** a Sales Order in open or partially delivered state • **When** I open that SO • **Then** the "Items not shipped" table remains fully editable. 2. **Adjust Committed Stock on Save** • **Given** I have changed the order quantity or source location on one or more lines in an

	BACK END		open SO
			• **When** I click the save buttons
			• **Then** the system recalculates committed stock as follows:
			  ◦ If Order Qty increases, add the difference to the selected locations committed balance
			  ◦ If Order Qty decreases, subtract the difference from the selected location's committed balance
			  ◦ If Source Location changes, release the line's committed amount from the old location and reserve the same amount in the new location
			3. **Persist Changes**
			• **Given** the SO has been saved with updated order quantities and/or source locations
			• **When** I reload or revisit the SO
			• **Then** all changes remain updated correctly.

FR-306
FINAL
	BACK END	As a user, I want the ability to delete line items that are in a Committed state, so that I can correct mistakes or clean up order data while preserving inventory accuracy once the record is saved.	1. **Delete Line Items in Committed State**
			• **Given** I am on a Sales Order with line items in a committed state
			• **When** I delete one or more committed line items from the "Items not shipped" table
			• **Then** click the save buttons
			• **Then** the system:
			  ◦ Permanently removes those lines from the Sales Order
			  ◦ Increases Available Stock in the linked location by the deleted quantity
			  ◦ Reduces Committed Stock in the linked location by the same quantity
			  ◦ Leaves linked location qty in stock unchanged

FR-307 FINAL @b.stevenson	DESIGN BACK END BACK END	As a user, I want deleting a delivered Sales Order to automatically return the delivered quantities to the location's in-stock balance, so that my inventory remains accurate when fully delivered orders are reversed or canceled.	1. **Show Delete Confirmation** • **Given** a Sales Order is fully delivered (all line items delivered) and not linked to an existing invoice • **When** I click the delete button • **Then** a confirmation message appears stating: "Deleting this delivered order will return the delivered quantities to each linked location's in-stock balance. This action cannot be undone. Do you wish to continue?" 2. **Restore In-Stock Quantities on Confirmed Deletion** • **Given** the confirmation message is displayed • **When** I click confirm • **Then** each line item's delivered quantity is added back to the linked location's In Stock balance, and the order is permanently deleted. 3. **Abort on Cancellation** • **Given** the confirmation message is displayed • **When** I click cancel • **Then** no changes occur to Method QoH or linked location in-stock balances, and the Sales Order remains unchanged. 4. **Restrict Delete for Linked Sales Orders** • **Given** a fully delivered Sales Order is linked to an existing Invoice • **When** I view the Sales Order • **Then** when I click the delete button a show message appears saying *"One or more delivered items are linked to an Invoice. To delete this order, please delete all associated Invoices first."*

			• **And** when the user deletes all associated invoices, then the delete button proceeds with regular flow.
FR-308 NEW @b.stevenson	DESIGN DESIGN DESIGN	As a user, I want the ability to undo deliveries for items that were mistakenly marked as delivered, so that I can restore those quantities back into stock and correct fulfillment errors without creating manual stock adjustments.	1. **Show Undo Button** • **Given** a I open a partially delivered or fully delivered Sales Order • **When** I view the “Items delivered” table, • **Then** an “Undo” button appears next to the table header • **And** the button is hidden if all items in the “Items delivered” tabled have been invoiced, if not then available for clicking. 2. **Open Undo Modal** • **Given** I the undo button is eligible to be clicked • **When** I click the button • **Then** a modal opens and it lists a table with only delivered items that have not yet been invoiced from the “Items delivered” table • **And** displays a message: “Choose which delivered items you would like to return to stock. Undoing these delivered orders will return the delivered quantities to each linked location’s in-stock balance. This action cannot be undone. Do you wish to continue?” • **And** the modal shows Cancel and Confirm buttons. 3. **Confirm Undo Action** • **Given** I have selected 1 or more delivered items from the table • **When** I click Confirm, • **Then** the modal closes,

	BACK END
	
	BACK END
	
	BACK END
			• **And** the selected delivered items are removed from the “Items delivered” table, leaving all unselected items as is
			• **And** for partially delivered orders:
			  ◦ If that undone item already had committed stock from the same source location in the “Items not shipped” table then the delivered qty is added into the qty to sell field
			  ◦ If that undone item does not have committed stock from the same source location in the “Items not shipped” table then a new row is added with the same source location and qty to sell equal to the qty previously delivered.
			• **And** for fully delivered orders:
			  ◦ The “Items not shipped” table reappears with the undone items populated with the same source location and qty to sell equal to the qty previously delivered.
			• **And** the Deliver button that contains the Deliver Fully and Deliver Partially buttons is visible again.
			4. **Inventory Adjustments on Undo**
			• **Given** an undo is confirmed,
			• **Then** the system updates inventory as follows:
			  ◦ Increases linked location qty in stock by the delivered quantity (reversing the deduction)
			  ◦ The same quantity is re-committed to that location (updating Committed stock accordingly).
			  ◦ Recalculates linked locations Available Stock accordingly

			◦ Recalculates Method QOH (Quantity in Stock) accordingly 5. **Stay on SO on Cancel** • **Given** the confirmation modal is displayed and I have either selected or not selected a delivered item • **When** I click Cancel • **Then** the modal closes and no changes are made to the “Items delivered” table 6. **Discard Unsaved Edits** • **Given** I have selected one or more delivered items inside the modal without clicking confirm • **When** I navigate away or reload the page • **Then** all unsaved changes are discarded and the order reverts to its last saved state.
FR-309 NEW @b.stevenson	DESIGN DESIGN DESIGN	As a user, I want to click a “Deliver Fully ” button to ship all remaining committed line items in one action, so that I can quickly complete fulfillment when all items are in stock and accurately update my delivery records.	**Deliver Fully Visibility** • **Given** a Sales Order in Open or Partially Delivered status, • **When** all committed inventory part line items have sufficient available stock at their chosen source locations, • **Then** when I click the “Deliver” button then the “Deliver Fully ” button becomes visible and enabled. • **And** if any committed line item has insufficient available stock, ◦ **Then** the “Deliver Fully ” button is hidden (only “Deliver Partially ” remains visible). **Trigger Deliver Fully** • **Given** the Deliver Fully button is visible, • **When** I click Deliver Fully , • **Then** a show message appears stating:

			"All committed line items have been shipped successfully." • **And** the show message includes an OK button.
	DESIGN		**Confirm and Update Fulfillment** • **Given** the show message is displayed, • **When** I click OK, • **Then** I am returned to the Sales Order screen, • **And** all line items that are inventory part items previously listed in the Items Not Shipped table are now moved into the Items Delivered table. • **And** each delivered line item retains: ◦ The same Source Location, ◦ A Qty Delivered value equal to Qty to Sell, ◦ A new Date Delivered column entry with the current date of delivery. ◦ The total ordered quantity equal to the original qty to sell amount • **And** the Items Not Shipped table no longer appears.
	DESIGN		**Merge with Existing Deliveries** • **Given** there were already line items in the Items Delivered table, • **When** I complete the Deliver Fully action, • **Then** the newly delivered line items are appended as new rows in the Items Delivered table, • **And** previously delivered rows remain unchanged. **Inventory and Order State Updates** • **When** Deliver Fully is confirmed, ◦ Each line item's Quantity in stock at the respective source location decreases by

			the delivered quantity. ◦ Each line item's Committed stock at the respective source location decreases by the same amount. ◦ Each line item's Available Quantity at the respective source location recalculates automatically. ◦ Total Quantity in Stock field for each line item recalculates automatically. • **And** the Sales Order status updates to "Fully Delivered". • **And** the Deliver button that contains the Deliver Fully and Deliver Partially buttons are no longer visible.
FR-310 NEW @b.stevenson	DESIGN DESIGN DESIGN	As a user, I want to select and deliver specific line items and their quantities from the sales order, so that I can complete partial shipments when only certain items are ready for delivery.	**Deliver Partially Visibility** • **Given** a Sales Order is in Open or Partially Delivered status, • **When** at least one committed inventory part line item exists in the Items Not Shipped table, • **Then** the Deliver Partially button is visible and enabled inside the deliver button. **Open Partial Delivery Modal** • **Given** I click the Deliver Partially button, • **When** the modal opens, • **Then** the modal displays a table showing all active Inventory Part line items sourced from active locations only from the Items Not Shipped table. • **And** the modal includes the following non-editable columns populated from the data in the items not shipped table: Item, Location, Available QTY, QTY to sell • **And** the modal includes the following editable column defaulted to blank: Quantity to Deliver

	DESIGN		• **And** a dialog message appears above the table stating: Please choose the items to partially deliver and specify the quantity to deliver. The quantity entered cannot exceed the item's available stock.

	DESIGN		**Quantity to Deliver Entry Rules**
			• **When** I enter a value in Quantity to Deliver,
			  ◦ **Then** it must be greater than 0 and less than or equal to Available Qty for that location.
			  ◦ **And** if I attempt to enter a value greater than Available Qty, and click Confirm, an inline warning appears:
			  "Insufficient stock available at this location. Please reduce delivery quantity."

	DESIGN		**No Selection Edge Case** • **Given** I open the modal but do not choose an item and enter any quantities to deliver, • **When** I click Confirm, • **Then** the system displays an inline message: "No items selected for delivery. Please specify at least one delivery quantity." • **And** no inventory changes occur.
	DESIGN		**Partial Delivery Confirmation** • **Given** all delivery quantities entered are valid, • **When** I click **Confirm** • **Then** a confirmation show message appears: "Partial delivery completed successfully." • **And** the modal closes, • **And** I return to the Sales Order screen. **Post-Confirmation Table Updates** • **When** I return to the SO screen after confirming partial delivery:

	BACK END		◦ Delivered line items move from Items Not Shipped → Items Delivered table in a new row with: ▪ The same Source Location, ▪ Qty Delivered = Quantity to Deliver, ▪ Date Delivered column = current date of delivery. ▪ The total ordered quantity equal to the original qty to sell amount ◦ If the same item was previously delivered before, a new row is added in *Items Delivered* rather than overwriting the prior record. ◦ Any partially fulfilled line items remain in the Items Not Shipped table with reduced Qty to Sell (equal to remaining unfulfilled quantity). ◦ If all line items have now been delivered, the *Items Not Shipped* table disappears entirely and SO status updates to “Fully Delivered”. ◦ If the “Items not shipped” table had service or non-inventory items then the table retains those entries but now in a general “Items” table. **Inventory and Order State Updates** • **When** partial delivery is confirmed: ◦ Each line item’s Quantity in stock at the respective source location decreases by the delivered quantity. ◦ Each line item’s Committed stock at the respective source location decreases by the same amount. ◦ Each line item’s Available Quantity at the respective source location recalculates automatically.

			◦ Total Quantity in Stock field for each line item recalculates automatically. • **And** the Sales Order status updates to "Partially Delivered" if any committed inventory part lines remain.
FR-311 NEW @b.stevenson	BACK END	As a user, I want the Sales Order's status to automatically reflect its fulfillment progress, so that I always have an accurate, real-time view of whether an order is open, partially delivered, or fully delivered based on its inventory state.	**Initial State — Open (All Committed Items)** • **Given** a Sales Order has been created and saved, • **When** all inventory part line items are committed and none are delivered, • **Then** the Sales Order's status is set to Open. ◦ "Open" = all inventory part line items are in *committed* state, and none have been delivered. ◦ **Inventory Impacts:** ▪ Quantities on each line are committed against inventory. ▪ No delivery records exist yet. **UI:** ▪ "Deliver Partially " and (if eligible) "Deliver Fully " buttons are visible. ▪ "Items Delivered" table is hidden. **Partially Delivered (Committed + Delivered Items)** • **Given** a Sales Order is in Open state, • **When** a Deliver Partially action is performed, • **And** one or more line items are successfully marked as delivered while others remain committed, • **Then** the Sales Order's status updates to Partially Delivered. ◦ "Partially Delivered" = the order contains a mix of *committed* and *delivered* inventory part items.

- **UI and Data Updates:**
  - *Items Delivered* table appears listing the delivered lines.
  - *Items Not Shipped* table remains visible for the remaining committed lines.
  - “Deliver Partially ” and (if stock permits) “Deliver Fully ” buttons remain active.

Fully Delivered (All Delivered Items)

- **Given** a Sales Order has at least one committed inventory part item,
- **When** all remaining committed items are delivered — either via:
  - a Deliver Fully action,
  - or a Deliver Partially action that fulfills all remaining committed quantities,
- **Then** the Sales Order status automatically updates to Fully Delivered.
  - “Fully Delivered” = all inventory part line items have been delivered and no committed items remain.
  - **UI and Data Updates:**
    - *Items Not Shipped* table disappears.
    - *Items Delivered* table lists all delivered lines with delivery dates.
    - “Deliver Partially ” and “Deliver Fully ” buttons are hidden.

Undo Action Edge Case #1

- **Given** a Sales Order is Fully Delivered,
- **When** a user performs an Undo action for one or more delivered (non-invoiced) line items,
- **Then:**
  - Those undone items move back to the *Items Not Shipped* table as committed.

- The Sales Order status changes from Fully Delivered → Partially Delivered.

Undo Action Edge Case #2

- **Given** a Sales Order is Partially Delivered,
- **When** all delivered (non-invoiced) line items are undone (no delivered lines remain),
- **Then** the status reverts to Open.

Partial Delivery That Completes the Order

- **Given** a Sales Order is Partially Delivered,
- **When** a user performs another Deliver Partially action,
- **And** the delivered quantities fulfill all remaining committed lines,
- **Then** the Sales Order automatically transitions to Fully Delivered.
- **And** the *Items Not Shipped* table disappears.
- **If** the "Items not shipped" table had service or non-inventory items then the table retains those entries but now in a general "Items" table.

Deletion Edge Case — All Committed Lines Removed

- **Given** a Sales Order is Partially Delivered,
- **When** the user deletes all remaining *committed* line items and saves the order,
- **Then** there are no more committed items left in the order,
- **Therefore** the Sales Order status automatically updates to Fully Delivered (since all remaining lines are delivered).
- **And** the *Items Not Shipped* table disappears, leaving only *Items Delivered*.
- **If** the "Items not shipped" table had service or non-inventory items then the table retains

			those entries but now in a general “Items” table.
FR-312 NEW @b.stevenson	BACK END	As a user, I want the Sales Order’s *Subtotal* and *Total* amount to automatically reflect the sum of all line item amounts across both the *Items Not Shipped* and *Items Delivered* tables, so that I always see an accurate order total that matches the sum of all product line values, exclusive of tax	1. **Subtotal and Total Calculation** • **Given** a Sales Order has one or more line items in the *Items Not Shipped* and Items Delivered table, • **When** those items are saved, • **Then** the *Subtotal* is calculated as: ◦ Subtotal = Σ (Qty to Sell × Unit Price) + Σ (Qty Delivered × Unit Price) for all items in Items Not Shipped and Items Delivered table similar to how we do it today • **And** the *Total* field reflects the Subtotal field just like today 2. **Dynamic Updates** • **When** any of the following occur: ◦ Line items are added, deleted, or edited, ◦ Quantities or unit prices change, ◦ Deliveries are made or undone, • **Then** both *Subtotal* and *Total* fields automatically recalculate on save just like it does today
FR-313 NEW @b.stevenson	DESIGN	As a user, I want the Sales Order list screen to display key order details and automatically update them as the order progresses, so that I can quickly understand each order’s financial and fulfillment status at a glance without opening individual records.	**Sales Order List View State** • **Given** the Sales Order list view is opened, • **When** the page loads, • **Then** the list contains columns: Date Created, Order #, Customer, Total, Due, Invoice Status, Order Status pre-filled based on the order information. • **And** the table works just like any list table does today. **Automatic Updates** • **When** any order changes through fulfillment or invoicing actions,

			• **Then** the corresponding columns update automatically to reflect the new state just like it does today.

FR 4: Invoice Inventory Behaviour

As a user, I want saving an Invoice in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-400 NEW		As a user, I want saving an Invoice in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.	1. **No Impact to Method Inventory Stock on Invoice Save** • **Given** I have created a new invoice or converted one from a SO, estimate or opportunity • **When** I click the save buttons • **Then** there is no impact to inventory stock tracked in method: Method QoH, committed, and expected stock are unaffected • **And** the invoice continues to keep track of accounting stock via QBO QoH like it does today.
FR-401 NEW @b.stevenson		As a user, when I convert a Sales Order into an Invoice, I want the new Invoice to include selected delivered items, so that I can bill customers accurately for items that have already been shipped.	1. **Invoice Button Visibility** • **Given** a Sales Order is *Partially Delivered* or *Fully Delivered* and with an invoice status of Not Invoiced or partially Invoiced, • **When** I open the Sales Order screen, • **Then** a "Create Invoice" button is visible and enabled. • **And** the button is hidden for: ◦ *Open* orders (no delivered items), or fully invoiced orders

2. **Open Create Invoice Modal**

- **Given** I click the create invoice button,
- **When** the modal opens,
- **Then** the modal displays table listing all delivered line items from the *Items Delivered* table that have not yet been invoiced.
- **And** the modal includes the following non-editable columns populated from the data in the Items delivered table: Item, Location, QTY delivered, Unit Price, and Amount
- **And** the modal includes a dropdown to choose AR account just like it does today
- **And** each row includes a Select checkbox for users to choose which items to invoice.
- **And** a dialog message appears above the table stating: “Select which delivered items you would like to invoice. Each selected item will be invoiced for the full delivered quantity.”

3. **Item Selection Rules**

- **When** I check one or more rows in the table,
  - **Then** those rows are marked for invoicing at their full delivered quantity.
- **If** no rows are selected and I click Confirm,
  - **Then** the system displays an inline message:

    “No items selected for invoicing. Please select at least one delivered item.”
  - **And** no invoice is created.

3. **Confirm Invoice Creation**

- **Given** I have selected one or more delivered, non-invoiced items,
- **When** I click Confirm,

			• **Then** I am redirected to the newly created Invoice screen, pre-filled just like it does today with: ◦ Customer details, ◦ Linked Sales Order reference, ◦ All selected delivered items with: ▪ *Qty Delivered = QTY Sold*, ▪ Unit Price = Rate, ▪ Same location information ▪ Tax rate equal to what was defined in the SO for each line item ▪ Totals automatically calculating like it does today 4. **Post-Invoice Updates on Sales Order** • **When** I return to the Sales Order: ◦ The *Items Delivered* table updates to show yes or no in the invoice column indicating what's been invoiced ◦ The Create Invoice button remains visible until all delivered items are invoiced. ◦ Once every delivered item is invoiced, the button is hidden.
FR-402 NEW @b.stevenson		As a user, I want the Sales Order's status to automatically reflect its invoicing progress, so that I can accurately track whether an order has not been invoiced, partially invoiced, or fully invoiced based on the billing state of delivered items.	1. **Initial State — Not Invoiced (No Invoices Created)** • **Given** a Sales Order is either Open, Partially Delivered, or Fully Delivered state • **When** no invoices have been created for any of its delivered line items, • **Then** the Sales Order's invoice status is set to Not Invoiced. ◦ "Not Invoiced" = No delivered items have been invoiced. ◦ **Inventory Impacts:**

- Quantities may be committed or delivered, but no accounting events have occurred.
- No invoice records exist yet.

UI:

- Create Invoice button visible if delivered (uninvoiced) items exist.

2. **Partially Invoiced (Some Delivered Items Invoiced)**

- **Given** a Sales Order is in *Partially Delivered* or *Fully Delivered* state,
- **When** an invoice is created for some, but not all, delivered items,
- **Then** the Sales Order's invoice status updates to Partially Invoiced.
  - "Partially Invoiced" = at least one delivered item has been invoiced, but at least one delivered item remains uninvoiced.
  - **UI and Data Updates:**
    - **Items Delivered** table shows an invoice column with either yes or no
    - **Create Invoice** button remains visible for remaining uninvoiced delivered items.

3. **Fully Invoiced (All Delivered Items Invoiced)**

- **Given** a Sales Order is in partially or fully delivered state and has at least one delivered item,
- **When** all delivered items have been invoiced,
- **Then** the Sales Order's invoice status automatically updates to Fully Invoiced.
  - "Fully Invoiced" = all delivered items have been invoiced, and no un-invoiced delivered items remain.

			◦ **UI:** ▪ *Items Delivered* table shows all lines with yes in the invoice column ▪ *Create Invoice* button hidden. 4. **Invoice Deletion Edge Case** • **Given** a Sales Order is Partially Invoiced or Fully Invoiced, • **When** an existing invoice linked to one or more of the delivered items are deleted, • **Then** the Sales Order's invoice status changes to Not Invoiced if all associated invoices are deleted • **And** Partially Invoiced if some delivered invoiced items remain

FR 5: Purchase Order Expected Stock Tracking

As a user, I need Purchase Orders to track expected stock and update in stock when received.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-500 FINAL		As an user, when I save a Purchase Order for inventory part items, I want the system to track their ordered quantities as "expected" stock per destination location so that I can see inbound inventory at a glance.	1. **Update Expected on PO Save** • **Given** I have created or edited a open unreceived Purchase Order with one or more inventory part line items, each with a destination location and order quantity • **When** I click Save on the Purchase Order • **Then** the system increases the "expected" stock metric for each item-location by the line's order quantity 2. **Exclude Non-Inventory and Service Items** • **Given** the Purchase Order contains service or non-inventory lines

			• **When** I save the Purchase Order • **Then** only inventory part line items contribute to expected stock; service/non-inventory lines do not affect expected values.
FR-502 FINAL @b.stevenson		As an user, when I delete an open (i.e., all line items in expected state) Purchase Order in Method, I want the system to reduce the expected stock by the PO quantities so that incoming inventory remains accurate.	1. **Show Deletion Confirmation** • **Given** a Purchase Order in Open status in Method with one or more inventory part line items and expected stock recorded for their destination locations • **When** I click Delete on that PO • **Then** a confirmation message appears stating: “Deleting this Purchase Order will remove the expected stock reservations for all line items from their destination location. This action cannot be undone. Do you wish to continue?” 2. **Process Deletion on Confirm** • **Given** the confirmation modal is displayed • **When** I click Confirm Delete • **Then** the system subtracts each line’s order quantity from the matching location’s expected stock 3. **Confirmation Dismissal** • **Given** the show message is displayed • **When** I click cancel • **Then** the PO is not deleted and there is no impact to location expected stock.
FR-503 FINAL @b.stevenson		As an user, when I delete a fully received Purchase Order in Method, I want the system to remove received quantities from my location quantity in stock, so that my inventory remains accurate	1. **Show Deletion Confirmation for Closed PO** • **Given** a Purchase Order is fully received and is not linked to an existing bill • **When** I click Delete button • **Then** a confirmation message appears stating: “Deleting this received order will remove all received inventory from linked

		and I get clear confirmation of what's being released.	location quantity in stock. This action cannot be undone. Do you wish to continue?" 2. **Process Deletion on Confirm** • **Given** the confirmation modal is displayed • **When** I click Confirm Delete • **Then** the system deletes the PO and removes received inventory from all line items location quantity in stock by ordered amount in PO. 3. **Confirmation Dismissal** • **Given** the show message is displayed • **When** I click cancel • **Then** the closed PO is not deleted and there is no impact to location stock.
FR-504 FINAL		As a user, I want to be able to update open or partially received Purchase Order, so that expected stock reflects the correct items, quantities and locations before items are received.	1. **Editable Fields on Open and partially received PO** • **Given** a PO in open or partially received state • **When** I open that PO • **Then** the "Items not received" table remains fully editable. 2. **Adjust Committed Stock on Save** • **Given** I have changed the receive quantity or destination location on one or more lines in an open PO • **When** I click the save buttons • **Then** the system recalculates expected stock as follows: ◦ If order quantity increased, add the difference to the destination location's expected stock ◦ If order quantity decreased, subtract the difference from the destination location's expected stock ◦ If location changed, subtract the full line order quantity from the old location's

			expected stock and add it to the new location's expected stock ◦ If both location and order quantity changed, subtract the old line's full quantity from the old location's expected stock, and add the new line's updated quantity to the new location's expected stock 3. **Persist Changes** • **Given** the PO has been saved with updated order quantities and/or destination locations • **When** I reload or revisit the PO • **Then** all changes remain updated correctly.
FR-506 FINAL		As a user, I want the ability to delete line items when they are in an Expected state, so that I can correct purchasing errors with proper inventory impact once the record is saved.	1. **Delete Line Items in Expected State** • **Given** I am on a Purchase Order with line items in an Expected state • **When** I delete one or more expected line items from the "Items not received" table • **Then** I click the Save buttons • **Then** the system: ◦ Permanently removes those lines from the Purchase Order ◦ Reduces Expected Stock in the linked location by the deleted quantity ◦ Recalculates Available Stock in the linked location accordingly ◦ Leaves linked location qty in stock unchanged
FR-507 FINAL @b.stevenson		As a user, I want deleting a partially received Purchase Order to remove both received and expected quantities from inventory, so that location in stock and expected stock remain	1. **Delete Option for Unlinked Purchase Orders** • **Given** a partially received Purchase Order is not linked to an existing Bill • **When** I view the Purchase Order • **Then** the delete button is available. 2. **Show Deletion Confirmation**

		accurate and I get clear confirmation of what's being removed.	• **Given** a Purchase Order with some lines received and others still expected, and is not linked to an existing Bill • **When** I click the delete button • **Then** a show message appears stating: "Deleting this Purchase Order will remove both received and expected quantities from inventory. Received quantities will be deducted from linked location quantity in stock, and expected quantities will be removed from incoming stock. This action cannot be undone. Do you wish to continue?" 3. **Reverse on Confirmed Deletion** • **Given** the show message is displayed • **When** I click confirm • **Then** only the expected quantities are subtracted from the linked location's Expected Stock • **And** the received quantities are subtracted from the linked location's In Stock balance, • **And** the Purchase Order is permanently deleted. 4. **Abort on Cancellation Dismissal** • **Given** the show message is displayed • **When** I click cancel • **Then** no changes occur to expected or in-stock quantities, and the Purchase Order remains unchanged. 5. **Restrict Delete for Linked Purchase Orders** • **Given** a Purchase Order is linked to an existing Bill • **When** I view the Purchase Order • **Then** the delete button is not available, and a message appears at the bottom of the screen stating:

			“One or more received items are linked to a Bill. To delete this order, please delete all associated Bills first.” • **And** when the user deletes all associated bills, then the delete button becomes available again.
FR-508 NEW @b.stevenson		As a user, I want the ability to undo receipts for items that were mistakenly marked as received, so that I can correct fulfillment errors and restore accurate stock balances without performing manual inventory adjustments.	1. **Show Undo Button** • **Given** I open a *Partially Received* or *Fully Received* Purchase Order • **When** I view the “Items Received” table, • **Then** an “Undo” button appears next to the table header. • **And** the button is disabled if all items in the *Items Received* table have already been billed; • **Otherwise,** it is enabled and clickable. 2. **Open Undo Modal** • **Given** the Undo button is eligible to be clicked, • **When** I click the Undo button, • **Then** a modal opens showing a table containing only *received items* that have not yet been billed, sourced from the *Items Received* table. • **And** the modal displays this message: “Choose which received items you would like to reverse. Undoing these receipts will reduce the received quantities and restore them as expected stock at each linked location. This action cannot be undone. Do you wish to continue?” • **And** the modal includes Cancel and Confirm buttons. 3. **Confirm Undo Action**

- **Given** I have selected one or more received items from the table,
- **When** I click Confirm,
- **Then** the modal closes,
- **And** the selected items are removed from the *Items Received* table (all unselected rows remain unchanged).
- **And** for partially received orders:
  - **If** the undone item already exists in the *Items Not Received* table (same item and destination location),
    - **Then** the received quantity is added back into that line's *Qty to Receive* field.
  - **If** the undone item does not exist in the *Items Not Received* table for that same location,
    - Then a new row is added to the *Items Not Received* table with:
      - The same Destination Location, and
      - *Qty to Receive* equal to the quantity previously received.
- **And** for fully received orders:
  - The *Items Not Received* table reappears, containing the undone items with the same destination location and *Qty to Receive* equal to the previously received quantity.
- **And** the *Receive* button (containing *Receive Fully* and *Receive Partially*) becomes visible and enabled again.

4. **Inventory Adjustments on Undo**

- **Given** an Undo action is confirmed,
- **Then** the system updates inventory as follows:
  - Decreases the linked location's Quantity in Stock (QOH) by the undone received

			quantity. ◦ Increases the linked location's Expected Quantity by the same amount (restoring "expected" stock). ◦ Recalculates the linked Available Stock accordingly. ◦ Updates Method's total Quantity in Stock to reflect the reduction. 5. **Stay on PO on Cancel** • **Given** the confirmation modal is displayed, • **When** I click Cancel, • **Then** the modal closes and no changes occur in the *Items Received* table or stock balances. 6. **Discard Unsaved Edits** • **Given** I have selected one or more received items inside the modal without clicking Confirm, • **When** I navigate away or reload the page, • **Then** all unsaved selections are discarded and the Purchase Order reverts to its last saved state.
FR-509 NEW @b.stevenson		As a user, I want to click a "Receive Fully" button to record all remaining expected items in one action, so that I can quickly complete receiving when all ordered items have arrived and keep my stock records accurate.	1. **Receive Fully Visibility** • **Given** a Purchase Order is in *Open* or *Partially Received* status, • **When** I click the Receive button, • **Then** the Receive Fully option is always visible and enabled. 2. **Trigger Receive Fully** • **Given** the Receive Fully button is visible, • **When** I click Receive Fully, • **Then** a show message appears stating:

“All expected line items have been received successfully.”

- **And** the show message includes an OK button.

3. **Confirm and Update Receiving**

- **Given** the show message is displayed,
- **When** I click OK,
- **Then** I am returned to the Purchase Order screen,
- **And** all inventory part line items previously listed in the *Items Not Received* table are now moved into the *Items Received* table.
- **And** each received line item retains:
  - The same Destination Location,
  - A Qty Received value equal to Qty to Receive,
  - A Date Received column entry populated with the current date of receiving
  - The total ordered quantity equal to the original qty to receive amount
- **And** the *Items Not Received* table no longer appears if there were no service or non-inventory part items
- **If** the “Items not shipped” table had service or non-inventory items then the table retains those entries but now in a general “Items” table.

4. **Merge with Existing Receipts**

- **Given** there were already line items in the *Items Received* table,
- **When** I complete the Receive Fully action,
- **Then** the newly received line items are appended as new rows in the *Items Received* table.

			• **And** all previously received rows remain unchanged.
			5. **Inventory and Order State Updates**
			• **When** Receive Fully is confirmed, the system updates inventory as follows:
			  ◦ Each line item's Quantity in Stock (QOH) at the respective destination location increases by the received quantity.
			  ◦ Each line item's Expected Quantity (incoming stock) decreases by the same amount.
			  ◦ Each location's Available Quantity recalculates automatically.
			  ◦ The item's Total Quantity in Stock field updates automatically to reflect the increase.
			• **And** the Purchase Order status updates to "Fully Received."
			• **And** the Receive button (which contains *Receive Fully* and *Receive Partially*) is no longer visible.

FR-510 NEW @b.stevenson		As a user, I want to select and receive specific line items and quantities from the purchase order, so that I can record partial receipts when only certain items have arrived.	1. **Receive Partially Visibility** • **Given** a Purchase Order is in Open or Partially Received status, • **When** at least one expected inventory part line item exists in the Items Not Received table, • **Then** the Receive Partially button is visible and enabled inside the Receive button. 2. **Open Partial Receiving Modal** • **Given** I click the Receive Partially button, • **When** the modal opens, • **Then** the modal displays a table showing all active Inventory Part line items sourced from

active destination locations only from the Items Not Received table.

- **And** the modal includes the following non-editable columns populated from Items Not Received: Item, Destination Location, Qty to Receive.
- **And** the modal includes the following editable column defaulted to blank: Quantity Received.
- **And** a dialog message appears above the table stating:

  Please choose the items to partially receive and specify the quantity received. The quantity entered cannot exceed the line's remaining Qty to Receive.

3. **Quantity to Receive Entry Rules**

- **When** I enter a value in Quantity Received,
  - **Then** it must be greater than 0 and less than or equal to the line's remaining Qty to Receive for that destination location.
  - **And** if I attempt to enter a value greater than the remaining Qty to Receive and click Confirm, an inline warning appears:

    "Quantity exceeds ordered quantity. Please reduce the received quantity."

4. **No Selection Edge Case**

- **Given** I open the modal but do not choose an item or enter any quantities received,
- **When** I click Confirm,
- **Then** the system displays an inline message:

  "No items selected for receiving. Please specify at least one received quantity."
- **And** no inventory changes occur.

5. **Partial Receiving Confirmation**

- **Given** all entered quantities are valid,
- **When** I click Confirm,
- **Then** a confirmation show message appears:

  “Partial receiving completed successfully.”
- **And** the modal closes,
- **And** I return to the Purchase Order screen.

6. **Post-Confirmation Table Updates**

- **When** I return to the PO screen after confirming partial receiving:
  - The received line items move from Items Not Received → Items Received as new rows with:
    - The same Destination Location,
    - Qty Received = Quantity Received,
    - Date Received = current date.
    - The total ordered quantity equal to the original qty to receive amount
  - If the same item/location was previously received, a new row is added in Items Received (do not overwrite prior receipts).
  - Any partially fulfilled line items remain in Items Not Received with reduced Qty to Receive (equal to the remaining unreceived quantity).
  - If all line items are now received, the Items Not Received table disappears if no service/non-inventory part items in table and PO status updates to “Fully Received.”
  - If the “Items not shipped” table had service or non-inventory items then the table retains those entries but now in a general “Items” table.

7. **Inventory and Order State Updates**

- **When** partial receiving is confirmed:

			◦ Each line's Quantity in Stock (QOH) at the respective destination location increases by the received quantity. ◦ Each line's Expected (incoming) quantity decreases by the same amount. ◦ Available Quantity at the destination location recalculates automatically. ◦ The item's Total Quantity in Stock in Method recalculates automatically. • **And** the Purchase Order status updates to "Partially Received" if any expected lines remain (otherwise "Fully Received.")
FR-511 NEW @b.stevenson		As a user, I want the Purchase Order's status to automatically reflect its receiving progress, so that I always have an accurate, real-time view of whether an order is open, partially received, or fully received based on its inventory state.	1. **Initial State — Open (All Expected Items)** • **Given** a Purchase Order has been created and saved, • **When** all inventory part line items are marked as expected and none have been received, • **Then** the Purchase Order's status is set to Open. ◦ Open" = all inventory part line items are in *expected* state, and none have been received. ◦ **Inventory Impacts:** ▪ Quantities on each line are expected and have not yet been added to stock. ▪ No receiving records exist yet. **UI:** ▪ Receive Partially and Receive Fully buttons are visible. ▪ Items Received table is hidden. 2. **Partially Received (Expected + Received Items)** • **Given** a Purchase Order is in Open state,

- **When** a Receive Partially action is performed,
- **And** one or more inventory part line items are successfully marked as received while others remain expected,
- **Then** the Purchase Order's status updates to Partially Received.
  - Partially Received" = the order contains a mix of *expected* and *received* inventory part items.
  - **UI and Data Updates:**
    - Items Received table appears listing all received lines.
    - Items Not Received table remains visible for remaining expected lines.
    - Receive Partially and Receive Fully buttons remain active.

3. **Fully Received (All Received Items)**

- **Given** a Purchase Order has at least one expected item,
- **When** all remaining expected inventory part items are received — either via:
  - a Receive Fully action, or
  - a Receive Partially action that fulfills all remaining expected quantities,
- **Then** the Purchase Order's status automatically updates to Fully Received.
  - "Fully Received" = all inventory part line items have been received, and no expected items remain.
  - **UI and Data Updates:**
    - Items Not Received table disappears.
    - Items Received table lists all received lines with their Date Received.

- Receive Partially and Receive Fully buttons are hidden.

4. **Undo Action Edge Case #1**

- **Given** a Purchase Order is Fully Received,
- **When** a user performs an Undo action for one or more received (non-billed) line items,
- **Then:**
  - Those undone items move back to the Items Not Received table as expected.
  - The Purchase Order status changes from Fully Received → Partially Received.

5. **Undo Action Edge Case #2**

- **Given** a Purchase Order is Partially Received,
- **When** all received (non-billed) line items are undone (no received lines remain),
- **Then** the Purchase Order status reverts to Open.

6. **Partial Receiving That Completes the Order**

- **Given** a Purchase Order is Partially Received,
- **When** a user performs another Receive Partially action,
- **And** the received quantities fulfill all remaining expected lines,
- **Then** the Purchase Order automatically transitions to Fully Received.
- **And** the Items Not Received table disappears if no service/non-inventory items in table
- If the “Items not shipped” table had service or non-inventory items then the table retains those entries but now in a general “Items” table.

7. **Deletion Edge Case — All Expected Lines Removed**

- **Given** a Purchase Order is Partially Received,

			• **When** the user deletes all remaining expected line items and saves the order, • **Then** there are no more expected items left in the order, • **Therefore** the Purchase Order status automatically updates to Fully Received (since all remaining lines are received). • **And** the Items Not Received table disappears if no service/non-inventory items in table, leaving only Items Received. • If the “Items not shipped” table had service or non-inventory items then the table retains those entries but now in a general “Items” table.

FR-512
NEW
@b.stevenson
		As a user, I want the Purchase Orders *Subtotal* and *Total* amount to automatically reflect the sum of all line item amounts across both the *Items Not Received* and *Items Received* tables, so that I always see an accurate order total that matches the sum of all product line values, with tax calculated.	1. **Subtotal and Total Calculation**
			• **Given** a PO has one or more line items in the *Items not received* and Items received table,
			• **When** those items are saved,
			• **Then** the *Subtotal* is calculated as:
			  ◦ Subtotal = Σ (Qty to receive × Unit Price) + Σ (Qty received × Unit Price) for all items in Items Not Received and Items Received table similar to how we do it today
			• **And** the tax field is calculated just like it does today similar to Invoices
			• **And** the *Total* field is calculated just like it does today similar to Invoices
			2. **Dynamic Updates**
			• **When** any of the following occur:
			  ◦ Line items are added, deleted, or edited,
			  ◦ Quantities or unit prices change,
			  ◦ Receives are made or undone,
			  ◦ Items tax code change
			• **Then** both *Subtotal*, Tax, and *Total* fields automatically recalculate on save just like it

			does today
FR-513 NEW @b.stevenson		As a user, I want the Purchase Order list screen to display key order details and automatically update them as the order progresses, so that I can quickly understand each order's financial and fulfillment status at a glance without opening individual records.	1. **Purchase Order List View State** • **Given** the PO list view is opened, • **When** the page loads, • **Then** the list contains columns: Date Created, Order #, Vendor, Total, Due, Bill Status, Order Status pre-filled based on the order information. • **And** the table works just like any list table does today. 2. **Automatic Updates** • **When** any order changes through fulfillment or billing actions, • **Then** the corresponding columns update automatically to reflect the new state just like it does today.

FR 6: Sales Receipt Inventory Behaviour

As a user, I want saving a Sales Receipt in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-600 NEW		As a user, I want saving a Sales Receipt in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.	1. **No Impact to Method Inventory Stock on Sales Receipt Save** • **Given** I have created a new sales receipt or converted one from an opportunity • **When** I click the save buttons • **Then** there is no impact to inventory stock tracked in method: Method QoH, committed, and expected stock are unaffected

			• **And** the sales receipt continues to keep track of accounting stock via QBO QoH like it does today.

FR 7: Bill Inventory Behaviour

As a user, I want saving a Bill in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.

ID	Design or Backend?	User Story	Acceptance Criteria
FR-700 NEW		As a user, I want saving a Bill in Method to have no impact on Method's inventory balances, so that inventory stock levels (Method QoH, committed, expected) remain unaffected.	1. **No Impact to Method Inventory Stock on Bill Save** • **Given** I have created a new Bill or converted one from a purchase order • **When** I click the save buttons • **Then** there is no impact to inventory stock tracked in method: Method QoH, committed, and expected stock are unaffected • **And** the Bill continues to keep track of accounting stock via QBO QoH like it does today.
FR-701 NEW @b.stevenson		As a user, when I convert a Purchase Order into a Bill, I want the new Bill to include selected received items, so that I can record vendor bills accurately for items that have already been received.	1. **Bill Button Visibility** • **Given** a Purchase Order is *Partially Received* or *Fully Received* and has a bill status of *Not Billed* or *Partially Billed*, • **When** I open the Purchase Order screen, • **Then** a "Create Bill" button is visible and enabled. • **And** the button is hidden for: ◦ *Open* orders (no received items), or ◦ *Fully Billed* orders. 2. **Open Create Bill Modal**

- **Given** I click the Create Bill button,
- **When** the modal opens,
- **Then** it displays a table listing all received line items from the Items Received table that have not yet been billed.
- **And** the modal includes the following non-editable columns populated from the data in the *Items Received* table: Item, Location, QTY Received, Unit Price, and Amount
- **And** each row includes a Select checkbox for users to choose which received items to bill.
- **And** a dialog message appears above the table stating: “Select which received items you would like to bill. Each selected item will be billed for the full received quantity.”

3. **Item Selection Rules**

- **When** I check one or more rows in the table,
  - **Then** those rows are marked for billing at their full received quantity.
- **If** no rows are selected and I click Confirm,
  - **Then** the system displays an inline message:

    “No items selected for billing. Please select at least one received item.”
  - **And** no bill is created.

4. **Confirm Bill Creation**

- **Given** I have selected one or more received, non-billed items,
- **When** I click Confirm,
- **And** I am redirected to the newly created Bill screen, pre-filled just like it does today with:
  - Vendor details,
  - Linked Purchase Order reference,
  - All selected received items with:

			▪ *Qty Received = Qty Received*, ▪ *Unit Price = Rate*, ▪ Same location information ▪ Tax rate equal to what was defined in the PO for each line item ▪ Totals automatically calculating like it does today 5. **Post-Bill Updates on Purchase Order** • **When** I return to the Purchase Order: ◦ The *Items Received* table updates to show bill status for the order ◦ The Create Bill button remains visible until all received items have been billed. ◦ Once every received item has been billed, the button is hidden.
FR-702 NEW @b.stevenson		As a user, I want the Purchase Order's status to automatically reflect its billing progress, so that I can accurately track whether an order has not been billed, partially billed, or fully billed based on the billing state of received items.	1. **Initial State — Not Billed (No Bills Created)** • **Given** a Purchase Order is in *Open*, *Partially Received*, or *Fully Received* state, • **When** no bills have been created for any of its received line items, • **Then** the Purchase Order's bill status is set to Not Billed. ◦ "Not Billed" = No received items have been billed. ◦ **Inventory Impacts:** ▪ Quantities may be expected or received, but no accounting events have occurred. ▪ No bill records exist yet. **UI:** ▪ **Create Bill** button visible if received (unbilled) items exist. 2. **Partially Billed (Some Received Items Billed)**

- **Given** a Purchase Order is in *Partially Received* or *Fully Received* state,
- **When** a bill is created for some, but not all, received items,
- **Then** the Purchase Order's bill status updates to Partially Billed.
  - "Partially Billed" = At least one received item has been billed, but at least one received item remains unbilled.
  - **UI and Data Updates:**
    - **Items Received** table shows bill status for the order
    - **Create Bill** button remains visible for remaining unbilled received items.

3. **Fully Billed (All Received Items Billed)**

- **Given** a Purchase Order is in *Partially Received* or *Fully Received* state and has at least one received item,
- **When** all received items have been billed,
- **Then** the Purchase Order's bill status automatically updates to Fully Billed.
  - "Fully Billed" = All received items have been billed, and no unbilled received items remain.
  - **UI:**
    - **Items Received** table shows all lines with yes or no for bill status
    - **Create Bill** button hidden (no remaining eligible lines).

4. **Bill Deletion Edge Case**

- **Given** a Purchase Order is *Partially Billed* or *Fully Billed*,
- **When** an existing bill linked to one or more received items is deleted,
- **Then:**

			◦ If all associated bills are deleted → The PO's bill status changes to Not Billed. ◦ If some billed items remain → The PO's bill status changes to Partially Billed.

FR 8: Transaction Conversion Flows

As a user, I need transaction conversions to intelligently handle location assignments while preserving data integrity.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-205 FINAL	BACK END Engineering can align to the existing Estimates/ Opportunities patterns and the recently updated SO/P	As a user, when I convert an Opportunity or Estimate into a Sales Order, I want the new Sales Order to carry over those items and quantities but require me to select a source location for all inventory part items only so that the order can be saved and inventory correctly allocated.	1. **Carry Over Items & Quantities** • **Given** I am viewing an Opportunity or Estimate • **When** I click "Create Sales Order" • **Then** the "New / Edit Sales Order" screens opens with the same items and quantities pre-populated, just like it does today with all relevant customer information. 2. **Require Location Selection** • **Given** the Sales Order has pre-populated inventory part line items • **When** the "New / Edit Sales Order" screen renders • **Then** each inventory part line item includes an empty "Source Location" dropdown. 3. **Persist Selection** • **Given** I have selected a source location with sufficient available stock for all inventory part items • **When** I save the Sales Order

	O screens. The only addition is a minimal banner to inform users to select a source location when entering those flows.		• **Then** each line's chosen location and quantity are persisted in the order record • **And** those selections remain unchanged when I reopen or reload the Sales Order. 4. **Error on Invalid Selection** • **Given** I attempt to save the Sales Order with a inventory part item that has no location selected • **When** I click the save buttons • **Then** the order is not saved, and a show message appears that says "Please select a source location for XYZ" and should mention which items requires a selection.
FR-212 FINAL	AS ABOVE	As a user, when I convert an Opportunity or Estimate into an Invoice, I want the new Invoice to carry over those items and quantities but require me to select a source location for all inventory part items only so that the invoice can be saved.	1. **Carry Over Items & Quantities** • **Given** I am viewing an Opportunity or Estimate • **When** I click "Create Invoice" • **Then** the "New / Edit Invoice" screens opens with the same items and quantities pre-populated, just like it does today with all relevant customer information. 2. **Require Location Selection**

			• **Given** the Invoice has pre-populated inventory part line items • **When** the “New / Edit Invoice” screen renders • **Then** each inventory part line item includes an empty “Source Location” dropdown. 3. **Persist Selection** • **Given** I have selected a source location with sufficient available stock for all inventory part items • **When** I save the Invoice • **Then** each line’s chosen location and quantity are persisted in the order record • **And** those selections remain unchanged when I reopen or reload the Invoice. 4. **Error on Invalid Selection** • **Given** I attempt to save the Invoice with a inventory part item that has no location selected • **When** I click the save buttons • **Then** the Invoice is not saved, and a show message appears that says “Please select a source location for XYZ” and should mention which items requires a selection.
FR-214 FINAL	AS ABOVE	As a user, when I convert a Estimate into an Purchase Order, I want the new PO to carry over those items, quantities, but require me to select a destination location for all inventory part items only, so that the PO can be saved and inventory correctly allocated.	1. **Carry Over Items & Quantities** • **Given** I am viewing an Estimate • **When** I click “Create Purchase Order”, then choose which items to include in the new PO • **Then** the “New / Edit Purchase Order” screens opens with the same items and quantities pre-populated, just like it does today with all relevant customer information. 2. **Require Location Selection**

			• **Given** the PO has pre-populated inventory part line items • **When** the “New / Edit Purchase Order” screen renders • **Then** each inventory part line item includes an empty “Destination Location” dropdown. 3. **Persist Selection** • **Given** I have selected a destination location for all inventory part items • **When** I save the PO • **Then** each line’s chosen location and quantity are persisted in the order record • **And** those selections remain unchanged when I reopen or reload the PO. 4. **Error on Invalid Selection** • **Given** I attempt to save the PO with a inventory part item that has no location selected • **When** I click the save buttons • **Then** the PO is not saved, and a show message appears that says “Please select a destination location for XYZ” and should mention which items requires a selection.
FR-217 NEW	AS ABOVE	As a user, when I convert a Sales Order into an PO, I want the new PO to include selected not shipped items, so that I can order items I need to be shipped.	1. **Purchase Order Button Visibility** • **Given** a Sales Order is Open or *Partially Delivered* • **When** I open the Sales Order screen, • **Then** a “Create Purchase Order” button is visible and enabled. • **And** the button is hidden for: ◦ *Fully Delivered Orders* 2. **Open Create PO Modal** • **Given** I click the create purchase order button,

- **When** the modal opens,
- **Then** the modal displays table listing all committed active items sourced from active locations from the items not shipped table
- **And** the modal includes the following non-editable columns populated from the items not shipped table: Item, Location, Available QTY, QTY to sell
- **And** the modal includes the following editable column defaulted to blank: Quantity to Receive
- **And** the modal includes a dropdown to choose Vendor account just like it does today
- **And** each row includes a Select checkbox for users to choose which items to PO.
- **And** a dialog message appears above the table stating: “Select which items you would like to purchase from your vendor and specify to quantity to receive.”

3. **Item Selection Rules**

- **When** I check one or more rows in the table,
  - **Then** those rows are marked for purchasing at the inputed receiving amount
- **If** no rows are selected and I click Confirm,
  - **Then** the system displays an inline message:

    “No items selected for purchasing. Please select at least one item.”
  - **And** no PO is created.

3. **Confirm Invoice Creation**

- **Given** I have valid inputs
- **When** I click Confirm,
- **Then** a show message appears:

  “Purchase Order created successfully.”

			• **And** I am redirected to the newly created PO screen, pre-filled just like it does today with:
			  ◦ Vendor details,
			  ◦ Linked Sales Order reference,
			  ◦ All selected items with:
			  ▪ QTY to Receive = Qty to Receive from modal,
			  ▪ Unit Price = Rate,
			  ▪ Source Location = Receive to
			  ▪ Tax rate equal to what was defined in the SO for each line item
			  ▪ Totals automatically calculating like it does today
			4. **Post-PO No Updates to Sales Order**
			• **When** I return to the Sales Order:
			  ◦ there are no updates made to the SO

FR-218 NEW	AS ABOVE	As a user, when I convert a Invoice into an PO, I want the new PO to include selected items, so that I can order items I need to invoice.	1. **Purchase Order Button Visibility** • **Given** an Invoice exist • **When** I open the Invoice screen, • **Then** a “Create Purchase Order” button is visible and enabled just like today. 2. **Open Create PO Modal** • **Given** I click the create purchase order button, • **When** the modal opens, • **Then** the modal displays table listing all active items sourced from active locations from the items table • **And** the modal includes the following non-editable columns populated from the items not shipped table: Item, Location, Available QTY, QTY • **And** the modal includes the following editable column defaulted to blank: Quantity to

Receive

- **And** the modal includes a dropdown to choose Vendor account just like it does today
- **And** each row includes a Select checkbox for users to choose which items to PO.
- **And** a dialog message appears above the table stating: “Select which items you would like to purchase from your vendor and specify to quantity to receive.”

3. **Item Selection Rules**

- **When** I check one or more rows in the table,
  - **Then** those rows are marked for purchasing at the inputed receiving amount
- **If** no rows are selected and I click Confirm,
  - **Then** the system displays an inline message:

    “No items selected for purchasing. Please select at least one item.”
  - **And** no PO is created.

3. **Confirm Invoice Creation**

- **Given** I have valid inputs
- **When** I click Confirm,
- **Then** a show message appears:

  “Purchase Order created successfully.”
- **And** I am redirected to the newly created PO screen, pre-filled just like it does today with:
  - Vendor details,
  - Linked Invoice for reference,
  - All selected items with:
    - QTY to Receive = Qty to Receive from modal,
    - Unit Price = Rate,
    - Source Location = Receive to

			▪ Tax rate equal to what was defined in the Invoice for each line item ▪ Totals automatically calculating like it does today 4. **Post-PO No Updates to Invoice** • **When** I return to the Invoice: ◦ there are no updates made to the Invoice

FR 9: Transaction Duplication

As a user, I need duplicated transactions to copy all location data without immediately affecting inventory.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-211 FINAL	BACK END	As a user, when I duplicate an existing Sales Order, I want the new order to copy just the items not shipped table without immediately affecting inventory, and then reserve stock only when I save the duplicated order.	1. **Duplicate button availability** • **Given** I have an existing Open or Partially Delivered Sales Order • **When** I open the sales order • **Then** the duplicate button is available • **And** not available if fully delivered 2. **Copy only Items not shipped table** • **Given** I click duplicate on the SO • **Then** a “New / Edit Sales Order” screen opens with every line copied from the items not shipped table only—Item, QTY to sell, Source Location, etc—exactly as in the original, with all relevant customer information. • **And** inventory is impacted only once the order is saved like always.
FR-215	BACK END	As a user, when I duplicate an existing Purchase Order, I	1. **Duplicate button availability**

FINAL		want the new order to copy just the items not received table without immediately affecting inventory, and then expect stock only when I save the duplicated order.	• **Given** I have an existing Open or Partially Received Purchase Order • **When** I open the PO • **Then** the duplicate button is available • **And** not available if fully delivered 2. **Copy only Items not received table** • **Given** I click duplicate on the PO • **Then** a “New / Edit Purchase Order” screen opens with every line copied from the items not received table only—Item, QTY to receive, Receive to, etc—exactly as in the original, with all relevant customer information. • **And** inventory is impacted only once the order is saved like always.
FR-217 FINAL	BACK END	As a user, when I duplicate an existing Invoice, I want the new Invoice to pre-populate all line items (including quantities and source location selections where applicable).	1. **Pre-Populate Duplicate Invoice** • **Given** I have an existing Invoice • **When** I click “Duplicate” on that Invoice • **Then** a “New / Edit Invoice” screen opens with every line copied—Item, Order Qty, and Source location (where applicable)—exactly as in the original, with all relevant customer information.
FR-219 FINAL	BACK END	As a user, when I duplicate an existing Bill, I want the new bill to pre-populate all line items (including quantities and receive to location selections where applicable).	1. **Pre-Populate Duplicate Bill** • **Given** I have an existing Bill • **When** I click “Duplicate” on that Bill • **Then** a “New / Edit Bill” screen opens with every line copied—Item, Qty, and Receive to Location (where applicable)—exactly as in the original, with all relevant customer information.

FR 10: Inactive Location Handling

As a user, I need proper handling of transactions referencing inactive locations to maintain data integrity.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-220 FINAL @b.stevenson		As a user, when I have an open Sales Order or Purchase Order that has any items sourcing from an inactive location, I want the system to clearly flag the issue, so transactions never post against inactive locations.	1. **Show Banner on Open/Partially SO and PO** • **Given** an Open/Partially Sales Order or Purchase Order has one or more lines sourcing from an Inactive location in the items not shipped/received table • **When** I open the order • **Then** I see a banner that says "This order has items sourced from an inactive locations. Please reassign to an active location or reactive the inactive location to proceed with those items." • **And** the locations that are inactive in the order have "(Inactive)" added to the end of the location name similar to how we handle item inactivity today • **And** once all locations are in the table are active again then the banner disappears.
FR-305 FINAL		As a user, I want to reassign lines that reference an inactive location to an active one so I can continue processing Sales Orders without breaking inventory accuracy.	1. **Reassign Line to Active Locations** • **Given** an open or partially delivered Sales Order has a line referencing an inactive location • **When** I change that line's location to an active location in the "Items not shipped" table and click Save • **Then** the system updates inventory accordingly: it releases the previously committed quantity from the inactive location

			and reserves the same quantity in the new location • **And** the document saves successfully
FR-505 FINAL		As a user, I want to reassign lines that reference an inactive location to an active one so I can continue processing Purchase Orders without breaking inventory accuracy.	1. **Reassign Line to Active Location** • **Given** an open or partially received Purchase Order has a line referencing an inactive location • **When** I change that line's location to an active location in the "Items not received" table and click Save • **Then** the system updates inventory accordingly: it decreases expected at the inactive location and increases it at the new destination • **And** the document saves successfully.

FR 11: Location Lifecycle Management [(Figma)]

As a user, I need to unlink, delete, archive, and reactivate locations with proper validation to maintain data integrity.

ID	Design or Back end?	User Story	Acceptance Criteria
FR-107 FINAL @b.stevenson	DESIGN	As a user, I want the system to block unlinking of a location that's still referenced by open transactions and has existing stok for an item so that I never orphan orders or lose stock data.	1. **Block Deletion on Open References and Existing Location Stock** • **Given** a linked location on the "New / Edit Inventory Part" item screen • **When** I click the delete (trash) icon on that location row • **Then** the system validates whether the location can be safely removed: ◦ **If** the location is referenced by any *open or partially delivered* Sales Orders or *open or partially received* Purchase Orders,

			→ a warning appears: > “You cannot remove this location because it’s set as the source on open orders. Please reassign or fulfill those orders first.” ◦ **Else if** the location is not referenced on any open transactions but still has stock on hand, → a warning appears: > “You cannot unlink this location because there’s stock associated with this location. Please perform a stock adjustment to remove all stock, or make the location inactive instead.” • **And** the location row remains visible and undeleted until the blocking conditions are resolved.
FR-108 FINAL @b.stevenson	DESIGN BACKEND DESIGN	As a user, I want to unlink a location from an item so that its stock is no longer tracked and the item’s total Method QoH reflects that removal.	1. **Open Confirmation Modal on Delete** • **Given** the linked location has no open/Partially Delivered Sales Order or open/Partially Received Purchase Order referencing it to this inventory part item or has existing location stock • **When** I click the delete (trash) icon on that location row in the “New / Edit Inventory Part” item screen • **Then** a modal appears with the title “Confirm Unlink Location” and message “Unlinking this location will remove it from this item. Do you wish to proceed?” 2. **Cancel Unlink** • **When** the “Confirm Unlink Location” modal is open • **And** I click the “Cancel” button or the “X” in the top right corner

	BACK END		• **Then** the modal closes with no change to the table. 3. **Confirm Unlink and Update to Total "Quantity in Stock"** • **When** the "Confirm Unlink Location" modal is open • **And** I click Confirm Unlink • **Then** the modal closes and the location row is removed and unlinked • **And** the total "Quantity in Stock" field accurately reflects the new sum. 4. **Persist Removal** • **Given** I have unlinked one or more location rows • **When** I reopen or reload the item screen • **Then** the removed locations do not reappear and the total "Quantity in Stock" field still reflects the remaining location quantities correctly.
FR-117 FINAL @b.stevenson	DESIGN BACK END	As a user, I want to archive locations that are still in use, so that they can no longer be used in future transactions but remain intact for reporting and auditing.	1. **Archive Flow** • **Given** I am on the Location Dashboard and have selected an applicable location (not Default location) • **When** the system verifies that the location is not the default location • **Then** the "Make Inactive" option is available on the Edit location Screen • **And** when I click the make inactive button then a modal appears stating "Making this location inactive will hide it from new transaction and item screen dropdowns. Existing transactions will remain unchanged. You can reactivate it at any time" with Cancel and Confirm buttons.

	BACK END		2. **Cancel Deletion** • **When** the confirmation modal is displayed • **And** I click the “Cancel” button or the “X” in the top right corner • **Then** the modal closes with no changes made anywhere.
	BACK END		3. **Confirm Make Inactive** • **When** the confirmation modal is displayed • **And** I click Confirm button • **Then** the modal closes, the location status changes to inactive • **And** all existing/historical transactions line items referencing this location still reference it but with a banner indicating inactivity for audit integrity • **And** all data associated with an inactive warehouse including quantity in stock, committed, and expected stock is recorded and saved.
	DESIGN		• **And** the locations that are inactive in all orders have “(Inactive)” added to the end of the location name similar to how we handle item inactivity today • **And** for every inventory part item linked to it, the system: ◦ Recomputes the item’s total “Quantity in Stock” as the sum of in stock quantities across all remaining linked active locations.
	BACK END		4. **Hide from New Transactions** • **Given** the location is Inactive • **When** I click any location-sourcing dropdown such as when linking a location to an item from the “New / Edit Inventory Part” item screen or when selecting the source/destination location in Sales Orders,

			Invoices, Purchase Orders, Sales Receipts and bills or when creating a stock adjustment
			• **Then** the inactive location does not appear as a selectable option.
			5. **Visibility Filtering**
			• **Given** I am on the Location Dashboard
			• **When** I click the filter icon
			• **Then** I can filter the list by:
			  ◦ Active Locations
			  ◦ Inactive Locations
			  ◦ All Locations
			6. **Relink to Primary Location Edge Case**
			• **Given** a location that is not the default Location is the only location linked to an item
			• **When** I make that location inactive from the Edit Location Screen confirmation modal
			• **Then** the item is relinked to the default Location
			• **And** the item's quantity in stock at the default location is set to 0 and the total Quantity in Stock field of the item reflects the sum of remaining linked locations (ie., 0)

FR-118 FINAL @b.stevenson	BACK END	As an user, when I make a location Inactive, I want inventory balances to remain intact, so data stays accurate without any surprises.	1. **Preserve Balances & Visibility** • **Given** I set a location to Inactive • **When** I view any item's Location table • **Then** that location and it's in stock quantity are not shown in the table • **And** its committed and expected stock remain recorded for this inactive location • **And** quantity in stock does not count towards the item's total Quantity in Stock.
FR-119 FINAL	DESIGN	As a user, I want to reactivate an inactive location at any time, so that I	1. **Activation Eligibility Check**

@b.stevenson	DESIGN BACKEND BACKEND	can start fulfilling stock from that location immediately.	• **Given** I am on the Location Dashboard and have selected an inactive location • **When** the system verifies that the location is inactive • **Then** the "Make Active" option is available on the Edit Location screen • **And** shows a banner that reads: *"This location is currently inactive and hidden from new transactions. Activating it will make it available again for item linking and transaction sourcing.* 2. **Open Confirmation Modal on Click** • **Given** the location is inactive • **When** I click the "Make Active" button in the Edit Location screen • **Then** a modal appears stating: *"Activating this location will make it available in locations dropdowns for new transactions, item screens and stock adjustments. Historical transactions will remain unchanged."* • **And** the modal shows Cancel and Confirm buttons. 3. **Cancel Activation** • **When** the confirmation modal is displayed • **And** I click the "Cancel" button or the "X" in the top right corner • **Then** the modal closes with no changes made. 4. **Confirm Make Active** • **When** the confirmation modal is displayed • **And** I click the Confirm button • **Then** the modal closes, the location status changes to active • **And** all location-related functionality (e.g., sourcing in transactions, linking in items,

			inventory calculations, stock adjustments) is restored for that location.

FR 12: Stock Metrics Display [(Figma)](#)

ID	Design or Back end?	User Story	Acceptance Criteria
FR-120 FINAL	DESIGN BACK END DESIGN	As a user, I want to see In Stock - QBO, In Stock - Method, Committed, Expected, and Available Stock to sell for each inventory part item in the items list view, So that I can quickly understand stock status and make informed sales and purchasing decisions.	1. **Display of Stock Metrics** • **Given** I am on the Items List Screen • **When** the table loads • **Then** it displays all items like it does today with an aggregate view of stock metrics across all active locations as the default state • **And** each inventory part item row displays the following columns clearly labeled: ◦ **Quantity on Hand - QBO** — total physical stock currently synced from QBO ◦ **Quantity in Stock** — total physical stock currently in all active locations ◦ **Committed** — total quantity allocated to open sales orders ◦ **Expected** — total quantity from open purchase orders not yet received ◦ **Available** — calculated as `Quantity In Stock - Committed + Expected` 2. **Data Accuracy** • **Given** the quantities are displayed in the Items table • **When** a transaction (e.g., Sales Order and/or Purchase Order) is created, edited, or closed

			• **Then** the quantities update to reflect the latest inventory state. 3. **Non-Inventory & Service Item Handling** • **Given** the table includes non-inventory part items or service items • **When** these item types appear in the table • **Then** the Quantity on Hand - QBO, Quantity In Stock, Committed, Expected, and Available fields remain blank.
FR-121 NEW	DESIGN	As a user, I want the ability to filter by location in the Items List view and have the stock metrics update based on the location chosen, so that I can quickly understand stock status for a specific location and make informed sales and purchasing decisions.	1. **Location Filter Control** • **Given** I am on the Items List screen • **When** the table loads • **Then** I have the ability to filter by a specific location, allowing me to view stock metrics granularly for all items linked to the selected location. 2. **Metrics Update by Location** • **Given** I have applied a location filter • **When** the Items List table refreshes • **Then** each inventory part item row displays updated values for: ◦ *Quantity in Stock* (quantity at the filtered location) ◦ *Committed* (open sales orders at the filtered location) ◦ *Expected* (open purchase orders tied to the filtered location) ◦ *Available Stock* (calculated as *In Stock – Committed + Expected* for the filtered location) ◦ And *Quantity on Hand – QBO* remains unchanged, since it is not location-specific. 3. **Clear Filter Behaviour** • **Given** I have applied a location filter

			• **When** I clear the filter • **Then** the Items List table reverts to displaying aggregate values across all active locations (i.e., the default state).

FR 13: Inventory Management Toggle Behaviour

ID	Design or Backend?	User Story	Acceptance Criteria
FR-1201 FINAL @b.stevenson	DESIGN DESIGN	As a System Admin, I want the ability to enable or disable Inventory Management at the account level through a toggle in Display Settings, So that I can control whether Method tracks physical inventory or only uses accounting stock — while ensuring that customized screens do not cause feature conflicts.	1. **Toggle Visibility & Access for Stock Screen Accounts** • **Given** I am a new or existing account with stock screens spanning inventory-impacting screens • **When** I navigate to Account Settings → Display • **Then** I see a new "Inventory Management" toggle (enable/disable) in usable state 2. **Toggle Visibility & Access for Existing Accounts with not all Apps** • **Given** I am an existing account that does not have all necessary apps installed • **When** I navigate to the inventory management toggle • **Then** I see the toggle in a greyed-out state with disabled chosen • **And** a message in the card reads "Inventory Management can only be enabled for accounts with sales and purchase transactions app pack installed in stock state. Please install missing app packs to enable this feature."

	DESIGN		• **And** if the user installs missing app packs and those apps are in stock state, the toggle becomes usable again. 2. **Toggle Visibility & Access for Existing Customized Accounts** • **Given** I am an existing account that has customized one or more inventory-impacting screens • **When** I navigate to the inventory management toggle • **Then** I see the toggle in a greyed-out state with disabled chosen
	DESIGN		• **And** a message in the card reads “Inventory Management cannot be enabled for accounts with customized inventory screens. Restore all affected screens to stock to enable this feature.” • **And** if the user reverts those screens to stock, the toggle becomes usable again. **3. Customization Rules** • **Given** the account has stock screens and the toggle is enabled • **When** the user customizes any of the inventory-impacting screens • **Then** the toggle automatically becomes greyed out in an enabled state
	DESIGN		• **And** a message in the card reads “Inventory Management cannot be disabled for accounts with customized inventory screens. Restore all affected screens to stock inventory state to gain access to this setting”. • **And** users cannot disable the toggle until the affected screens are reverted to their stock inventory state, and once done then the toggle becomes usable again.

4. Enable Flow (No Customizations)

- **Given** the toggle is disabled and the screens are all in stock state
- **When** the user toggles to enabled
- **Then** a confirmation message appears: “You are about to enable Inventory Management.

  All inventory features and UI will become visible, and Method will begin tracking stock using *Quantity in Stock*, *Committed*, *Expected*, and *Available*.

  Transactions created while Inventory Management was disabled will not be included in these counts. To ensure accurate inventory, you may need to perform stock adjustments or use a bulk export/import action.

  Once enabled, if you customize any inventory-related screens, the toggle will become locked and cannot be turned off until those screens are reverted to their stock inventory state.”
- **And** after confirming and saving changes:
  - Inventory UI and validations appear
  - Inventory tracking begins on all supported screens
  - Any transactions created while off remain excluded from Method inventory.

5. Disable Flow (No Customizations)

- **Given** the toggle is enabled and all inventory-impacting screens are stock
- **When** the user toggles to disabled
- **Then** a confirmation message appears:

  “You are about to disable Inventory Management. All inventory features and UI

			will be removed, and your account will return to accounting stock state. Any transactions created while Inventory Management is disabled will not be reflected in Method inventory if you re-enable it later." • **And** after confirming and saving changes: ◦ Inventory UI and validations are removed ◦ Account reverts to accounting-only stock state.

FR 14: Decoupled Inventory Management from QBO

ID	Design or Back end?	User Story	Acceptance Criteria
FR-123 FINAL	BACK END	As a user, I want Quantity in Stock (QoH) to be decoupled from QBO Quantity on Hand, so that inventory levels in Method remain under Method's control and are not impacted by item or transaction updates from QBO.	1. **QBO Item Updates** • **Given** I update an item's Quantity on Hand in QBO • **When** the change syncs into Method • **Then** Method QoH does not update. 2. **QBO Transaction Creation/Updates** • **Given** I create/update/delete a transaction (Invoice, Sales Receipt, Purchase Order, Bills) in QBO that changes quantities • **When** the changes syncs into Method • **Then** Method QoH, committed, and expected quantities remains unchanged. 3. **No Relation Between the Two** • **Given** Method QoH is decoupled from QBO • **When** I perform inventory adjustments or inventory impacting transactions within Method • **Then** only Method QoH, committed, and expected quantities is updated, independent

			of QBO QoH.
FR-124 FINAL	BACK END	As a user, I want new inventory part items created in QBO to sync into Method with Method QoH and default location automatically assigned, so that I can begin tracking stock right away.	1. **Sync New QBO Items With QoH** • **Given** a new inventory part item is created in QBO with a QBO QoH • **When** it syncs into Method • **Then** the item appears in Method with Method QoH = QBO QoH • **And** the default location assigned to the item with location quantity = QBO QoH • **And** both the Method QoH and Location quantity fields are non-editable • **And** the "Adjust Stock" button is available to use for stock adjustments.
FR-125 FINAL	BACK END	As a user with Inventory Management enabled, I want Method to always track inventory changes from transactions created or updated in Method, but ignore QBO changes for finalized transactions, so that QuickBooks updates don't overwrite Method's inventory quantities.	1. **Default flag behaviour** • **Given** I enable Inventory Management toggle from display settings on my Method account • **When** a new or existing Sales Order or Purchase Order is created or opened in Method • **Then** the Wait for Sync Approval flag is checked by default. 2. **Inventory Ignored Once Synced to QBO (Sync Approval Unchecked)** • **Given** a transaction has synced to QBO (i.e., it has a QBO Transaction ID or the "Wait for Sync Approval" flag is unchecked) • **When** changes are made to that transaction in QBO • **Then** Method QoH, expected, and committed stock remain unchanged, but the changes made do reflect in the transaction in Method. 3. **Inventory Tracking With Sync Approval Checked**

			• **Given** the “Wait for Sync Approval” flag is checked on a transaction (SO, PO) • **When** I create or update the transaction in Method • **Then** Method’s inventory calculations for QoH, expected, and committed stock are updated accordingly • **And** are always tracked no matter if the flag is checked or unchecked. 4. **Sales Orders Always Impact Inventory** • **Given** Sales Orders do not sync with QBO • **When** I create or update a Sales Order in Method • **Then** the “Wait for Sync Approval” flag is always checked, and the transaction always impacts Method’s inventory calculations. 5. **REST API guardrail** • **Given** a transaction has a QBO Transaction ID • **When** an update is made via Method’s REST API • **Then** inventory calculations are not triggered, since the transaction is considered finalized.
FR-126 NEW	BACK END	As a user, I want QBO transactions to continue syncing into Method for accounting purposes without impacting Method QoH by default, so that I can choose whether to make them inventory-impacting by explicitly assigning a location.	1. **Sync QBO Transactions for Accounting** • **Given** an Invoice, Sales Receipt, or Purchase Order is created or updated in QBO • **When** the transaction syncs into Method • **Then** the transaction appears in Method with all accounting-related details intact for visibility and reporting just like it does today. • **And** no impact to Purchase order statuses based on updates made from QBO. 2. **No Method Stock Impact by Default**

- **Given** a Invoice, Sales Receipt, or Purchase Order has synced from QBO into Method
- **When** I review Method QoH, committed, and expected stock for items on that transaction
- **Then** Method QoH, committed, and expected stock remains unchanged and is not impacted from QBO transaction creations/updates.

3. **Location Field Empty on Sync**

- **Given** a Invoice or Purchase Order has synced from QBO into Method
- **When** I view the transaction in Method
- **Then** the location and available qty fields are empty.

4. **Method Stock Updates Only After Location Assignment for PO only**

- **Given** a Invoice or Purchase Order has synced from QBO into Method with an empty location field
- **When** I explicitly assign a location and save the transaction in Method with valid available qty
- **Then** Method QoH, committed, and expected stock updates for PO only, making it inventory-affecting from that point forward.
- **And** Invoices do not impact Method QoH, committed, and expected stock when a location is assigned and saved since these transactions are accounting only.

5. **No Impact from Bill Transactions**

- **Given** a bill was created, updated and/or paid for in QBO
- **When** those changes sync to Method
- **Then** Method QoH, committed, and expected stock remains unchanged and is not

			impacted from QBO transaction creations/updates.
FR-127 NEW	BACK END	As a user, I want Method to automatically update the accounting status of Sales Orders and Purchase Orders when their linked Invoice or Bill is deleted in QBO, so that the order's financial state in Method always reflects the true accounting state.	**Update SO and PO Status on Invoice/Bill Deletion Events** • **Given** an Invoice or bill that is linked to a SO or PO in method was deleted in QBO when those changes sync to Method • **Then** the accounting statuses related to the SO and PO update accordingly

FR 15: Validation from Epic 1

ID	User Story	Acceptance Criteria
FR-114	As a user, I want to edit an existing warehouse's details from the Warehouse Dashboard so that I can update its Location Name, Legal Name, and Address—and have those changes flow through all linked transactions.	1. **Propagate Updates to All Linked Transactions, Item Screens & Stock Adjustments** • **Given** the warehouse details have been updated and saved • **When** I view any existing Sales Order, Invoice, Purchase Order, or Bill that is sourced or shipped to this warehouse, any inventory part items linked to this warehouse, and any stock adjustment associated with this warehouse • **Then** those transactions and items display the new Location Name, Legal Name, and Address wherever the warehouse is referenced (where applicable).
FR-121	As an user, I want the system to prevent duplicate warehouse information anywhere they can be created or renamed, so that locations remain uniquely identifiable across items and transactions.	1. **Global uniqueness** • **Given** I am creating a new warehouse (from the Warehouse Dashboard or Item screen) or renaming an existing warehouse (Edit Location screen) • **When** the Location Name, Legal Name, or Address matches an existing warehouse in my

		account (active or inactive)
		• **Then** the save is blocked and an error message appears, specifying which field is duplicated:
		  ◦ "A warehouse with this Location Name already exists. Location Names must be unique. Choose a different name."
		  ◦ "A warehouse with this Legal Name already exists. Legal Names must be unique. Choose a different name."
		  ◦ "A warehouse with this Address already exists. Addresses must be unique. Choose a different Address."
		• **And** display an error message for combination duplicates for ex:
		  ◦ "A warehouse with this Location Name and Legal Name already exists. Location Names and Legal Names must be unique. Choose a different name."

FR-103	As a user, I want to prevent duplicate warehouses linking to an item, so that I can track stock separately in locations I've already defined.	1. **Update Default Warehouse Row with an Existing Warehouse** • **Given** I'm on a "New / Edit Inventory Part" item screen viewing the warehouses table and it shows the linked default warehouse dropdown • **When** I click that dropdown and choose "Warehouse A" from the list of all existing warehouses • **Then** the first row's Warehouse Name is set to "Warehouse A" and has empty QTY field. 2. **Add Existing Warehouse Row (All Rows After First Entry)** • **Given** I'm on a "New / Edit Inventory Part" item screen viewing the Warehouses table • **When** I click "Add Existing Warehouse" button • **Then** a new blank row appears after previous warehouse rows with a dropdown "Select

Warehouse" of all existing warehouses in the Warehouse Name column. (refer to designs).

3. **Select Non-Duplicate Warehouses**

- **Given** the "Select Warehouse" dropdown is open
- **When** I select a warehouse (e.g., Warehouse A) from the list
- **Then** the row's Warehouse Name becomes "Warehouse A" and has empty QTY fields.

4. **Prevent Duplicates**

- **Given** "Warehouse A" is already linked to this inventory part item
- **When** I click "Add Existing Warehouse", and choose "Warehouse A" from the "Select Warehouse" dropdown in the new row
- **Then** a show message immediately appears and says "Warehouse A is already linked to this inventory part item. Please choose an unlinked warehouse if you wish to proceed"
- **And** the row returns to the "Select Warehouse" dropdown state.

5. **Persist Linked Warehouses on Save**

- **Given** I have linked one or more existing warehouses
- **When** I click the save button
- **Then** the new warehouse links are saved
- **And** when I reopen or reload the item screen, the linked warehouses appear in the table

6. **Discard Unsaved Warehouse Additions**

- **Given** I have added one or more existing warehouses in the Warehouses table but have not clicked save on the item screen
- **When** I close the window, navigate away, or reload the screen

		• **Then** any unsaved warehouse rows are discarded and the table reverts to the last saved state.
FR-105 NEW	As a user, when creating a new inventory part item I want to manually enter the item's initial stock and have the system validate it against the sum of all warehouse quantities on save so that I can ensure my overall stock level remains consistent.	1. **Initial "Quantity in Stock" Non-Editable Upon Item Creation** • **Given** I am on a "New / Edit Inventory Part" item screen creating a new item • **When** I view the total "Quantity in Stock" field • **Then** the field is non-editable and is equal to the sum of linked locations quantity in stock. 2. **Persist Total After Save** • **Given** I have entered a valid total QTY's for all locations • **When** I click the save button on the item screen • Then the active warehouse QTYs sum to the entered total which equals the total "Quantity in Stock" field • **Then** the item saves successfully and the manually entered QTY's are persisted • **And** when I reopen or reload the item screen, the total "Quantity in Stock" field and each warehouse's QTY displays the last saved values and is non-editable 5. **Zero Default** • **Given** all warehouse QTYs are zero/empty • **When** I open the Item screen • **Then** the total "Quantity in Stock" field defaults to "0.00". 6. **Discard Item Creation** • **Given** I have modified the warehouse QTYs, or any other field without saving upon Item creation flow • **When** I navigate away, close the window, or reload

		• **Then** the item is not saved and cannot be accessed from the items table. 7. **Non-Editable Quantity Fields After Creation** • **Given** I have successfully created and saved a new inventory part item • **When** I return or reload that new items “New / Edit Inventory Part” item screen • **Then** the “Quantity in Stock” and Location Quantity fields are non-editable and cannot be updated directly anymore. • **And** I see a new button called “Adjust Stock” next to “Save & Back” button.
FR-122 NEW	As a user, I want to view a centralized log of all stock adjustments, so that I can track historical changes to item quantities across all locations in one place.	1. **Stock Adjustment Log Access** • **Given** I am on the “Items List” screen • **When** I view the screen • **Then** I see a new tab labeled “Adjusted Stock” next to “All Items.” 2. **Viewing the Log** • **Given** I am on the “Items List” screen • **When** I click on the “Adjusted Stock” tab • **Then** I am navigated to a table of all stock adjustments with the following columns: Date, Item, Details, and Reason for Adjustment. 3. **Empty State** • **Given** there have been no stock adjustments • **When** I view the “Adjusted Stock” tab • **Then** the table displays as empty. 4. **Populated State** • **Given** stock adjustments have been made • **When** I view the “Adjusted Stock” tab • **Then** the table displays one row per adjustment with: ◦ The Date entered from the modal

		◦ The Item adjusted ◦ The Reason for Adjustment entered from the modal ◦ The Details in the format: *"Quantity adjusted from X to Y in Location Z."*

Success Metric

Success Metric	Acceptance Criteria
15% of Wholesale & Distribution accounts have 2 or more active locations on day 30 post-general availability.	**Objective**: Run a SQL query to determine how many accounts have 2 or more active locations at exactly 30 days post-GA. This is a snapshot metric to identify steady-state adoption over time when the query is run. **Acceptance Criteria:** • Track all accounts with multi-location management toggle enabled only • Track only active locations • Vertical Information • Exclude internal and test accounts **Goal:** Measure true adoption intent with our ICP audience but have data across verticals to obtain more signals.
15% of Wholesale & Distribution accounts have fulfilled core transactions (partially or fully delivered/received) involving one or more unique location within the last 30 days.	**Objective**: Run a SQL query to determine how many accounts have fulfilled at least one Sales Order or Purchase Order (i.e., moved into a *Partially Delivered*, *Fully Delivered*, *Partially Received*, or *Fully Received* state) where one or more distinct active locations were used across the transaction's line items within the last 30 days. **Acceptance Criteria:** • An account qualifies if: ◦ It has at least one SO or PO that reached a partially or fully fulfilled state within the last 30 days

	◦ And the fulfillment involved one or more distinct active locations across the transaction's line items • It does not require the account to create or fulfill both SO *and* PO — one is sufficient • Definition of fulfillment: ◦ Sales Orders: Status = *Partially Delivered* or *Fully Delivered* ◦ Purchase Orders: Status = *Partially Received* or *Fully Received* • Only include accounts with the Multi-Location Management (MLM) toggle enabled • Only count active locations at the time of fulfillment • Exclude internal and test accounts • Vertical tagging: ◦ Restrict primary metric to Wholesale & Distribution accounts ◦ Still capture data across all verticals for internal signals and broader insights
10% of Sales Orders and Purchase Orders that reach a fulfillment state (Partially or Fully) within 30 days of creation	**Objective**: Run a SQL query to determine how many Sales Orders (SO) and Purchase Orders (PO) progress from creation to a fulfillment state within 30 days of creation. This metric captures real operational adoption — showing that users aren't just creating transactions, but are completing core fulfillment workflows within a healthy operational window. **Acceptance Criteria:** • It is a Sales Order or Purchase Order. • It reaches a fulfillment state (*Partially Delivered/Received* or *Fully Delivered/Received*) within 30 days of its creation date. • Only include transactions associated with accounts that have the Multi-Location Management (MLM) toggle enabled. • Exclude internal and test accounts • Transactions must have been created at least 30 days prior to the measurement date to ensure a full evaluation window. • Capture data across all verticals for internal signals and broader insights

15% of Wholesale & Distribution accounts have fulfilled core transactions (partially or fully Invoiced/Billed) within the last 30 days.	**Objective**:
	Run a SQL query to determine how many accounts have fulfilled at least one Sales Order or Purchase Order (i.e., moved into a *Partially or Fully Invoiced or Billed* state) within the last 30 days.
	
	Acceptance Criteria:
	• An account qualifies if:
	  ◦ It has at least one SO or PO that reached a partially or fully fulfilled accounting state within the last 30 days
	• It does not require the account to create or fulfill both SO *and* PO — one is sufficient
	• Definition of fulfillment:
	  ◦ Sales Orders: Status = *Partially Invoiced* or *Fully Invoiced*
	  ◦ Purchase Orders: Status = *Partially Billed* or *Fully Billed*
	• Only include accounts with the Multi-Location Management (MLM) toggle enabled
	• Exclude internal and test accounts
	• Vertical tagging:
	  ◦ Restrict primary metric to Wholesale & Distribution accounts
	  ◦ Still capture data across all verticals for internal signals and broader insights

Analytics

User Story	Acceptance Criteria

As a PM, I want to query which accounts have Inventory Management enabled, so that I can track adoption and report on enablement.	**Objective**:
	Run a SQL query to determine how many accounts have Inventory Management toggle enabled. This is a snapshot metric to track real-time adoption.
	• **Acceptance Criteria:**
	  ◦ Account Name, Date Turned On, Vertical
	  ◦ Type of user that turned it on
	  ◦ Exclude internal and test accounts
