2-4 2025 BIG BET

Align with engineering and design on the Big Bet or MLP solution & experience.

This document outlines the scope of user stories planned for 2025 implementation under the Big Bet initiative for the Sales Management team. The stories are grouped into three batches, with the numbering indicating the order in which they will be worked on.

Its important to note that all of the low-effort ratings were given a caveat that we have a solution for ensuring partially-functioning solutions aren't delivered to our customers – the **risk** of all the low-effort tasks is extremely high, and it would be irresponsible to not take steps to mitigate that risk to our customers

Prioritization of Big Bet User Stories

We have moved beyond defining epics and validating feature direction to now systematically prioritizing our user stories for development. Our prioritization framework was built on three key inputs:

1. **Epic grouping** into Batch 1 (P1), Batch 2 (P2), and Batch 3 (P3) based on product value and urgency
2. **Decomposition** of each epic into granular, job-driven user stories
3. **Impact/Effort scoring** of each user story to determine implementation feasibility and ROI

To ensure we are delivering high-impact functionality early, we applied an impact-effort matrix to each user story within its respective batch. This allowed us to score and sort features not only by their potential business value but also by the effort required to implement them. The result is a refined prioritization that elevates low-effort, high-impact stories to the top of our development queue—maximizing momentum and user value as we prepare for the build phase.

Impact/Effort Matrix

Using a FigJam-based impact/effort matrix, the full product team—including developers, product management, and product design—collaboratively scored each user story based on its implementation feasibility and anticipated user impact.

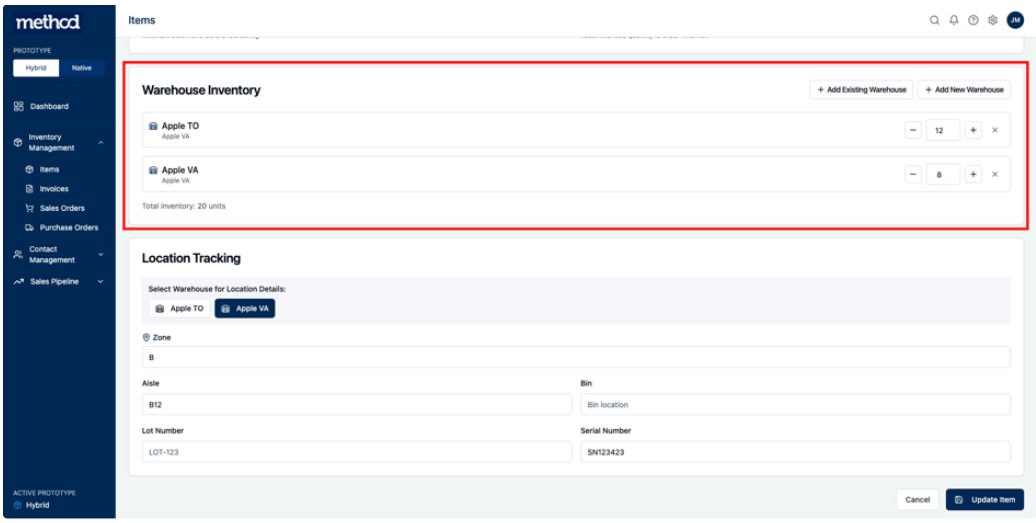
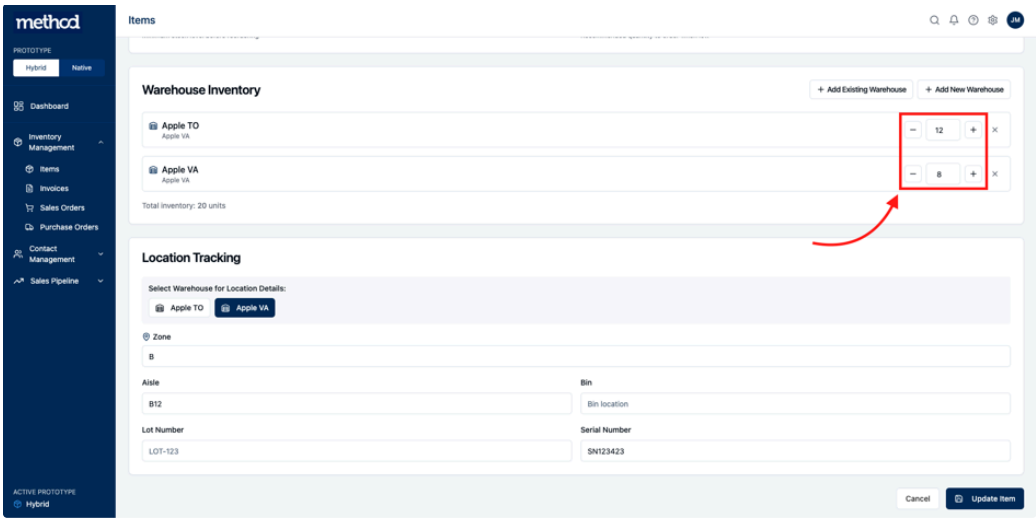
Batch 1:

Batch 1 includes the foundational inventory features that directly address the most pressing user pain points and deliver immediate value for MWD users.

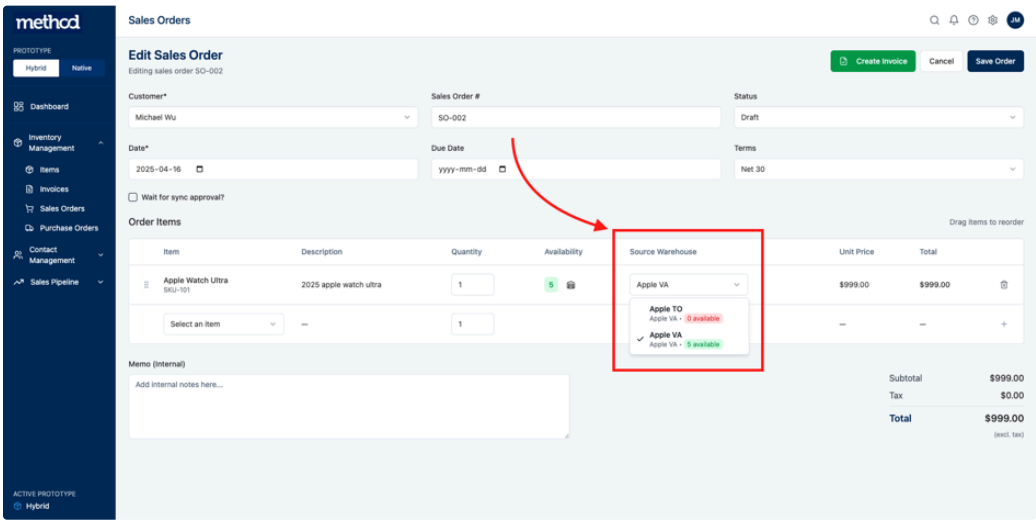
1. As a user, I want to define and manage multiple warehouses per item so that I can track stock separately for each location HIGH IMPACT LOW EFFORT



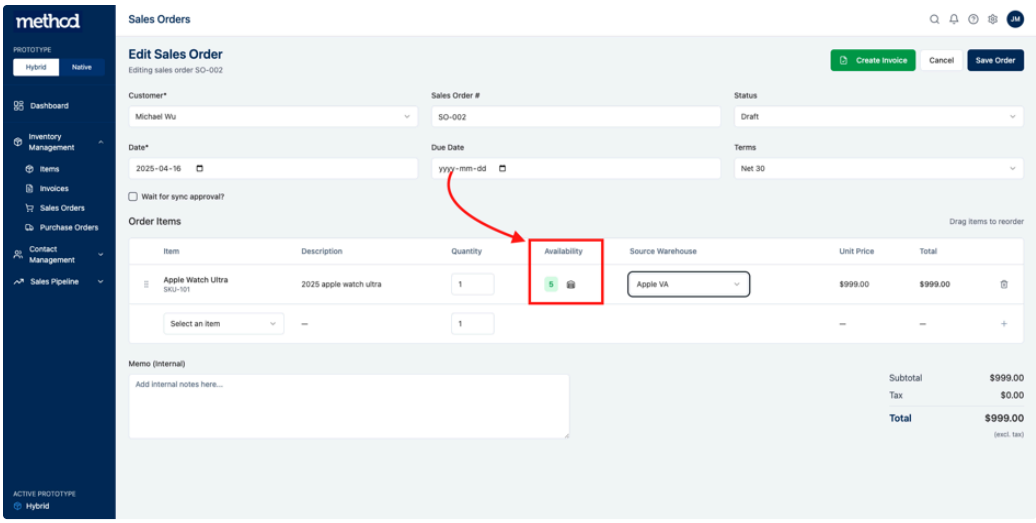
2. As a user, I want to update on-hand quantities for each warehouse independently so that each location's inventory remains accurate HIGH IMPACT LOW EFFORT



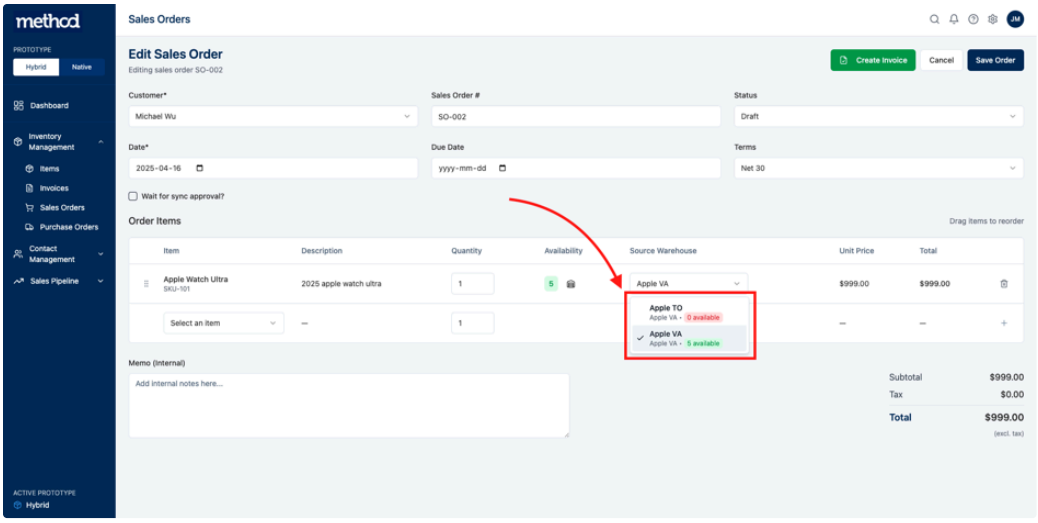
3. As a user, I want to choose which warehouse will fulfill each line item in my transactions so that orders are sourced from the correct location HIGH IMPACT LOW EFFORT

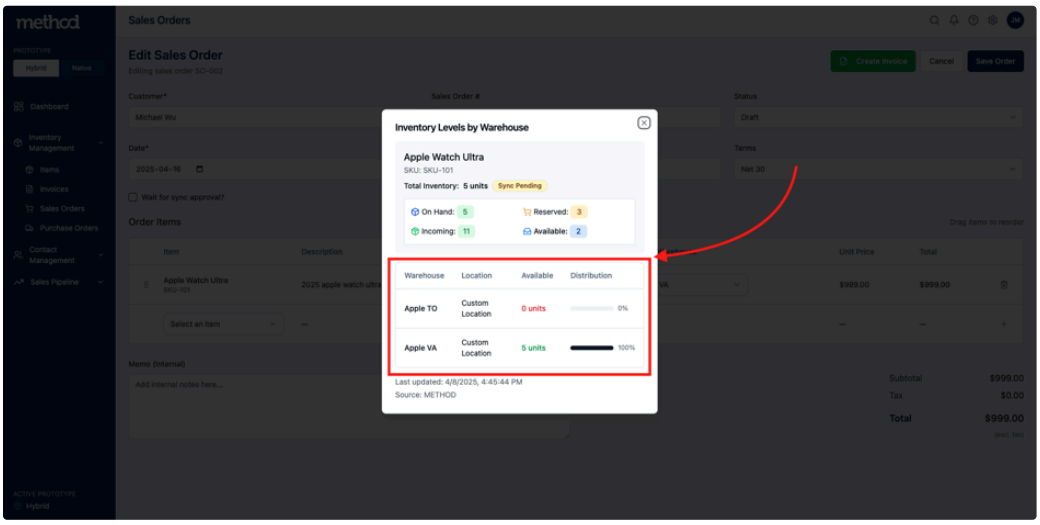


4. As a user, I want to view available inventory levels across all transactional workflows (estimates, sales orders, invoices, etc.) so that I always see up-to-date stock HIGH IMPACT LOW EFFORT

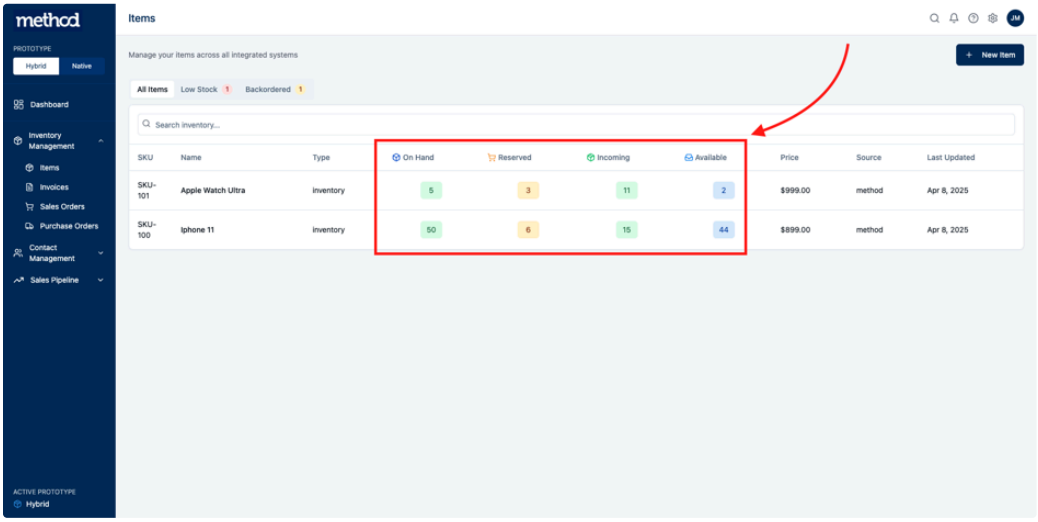


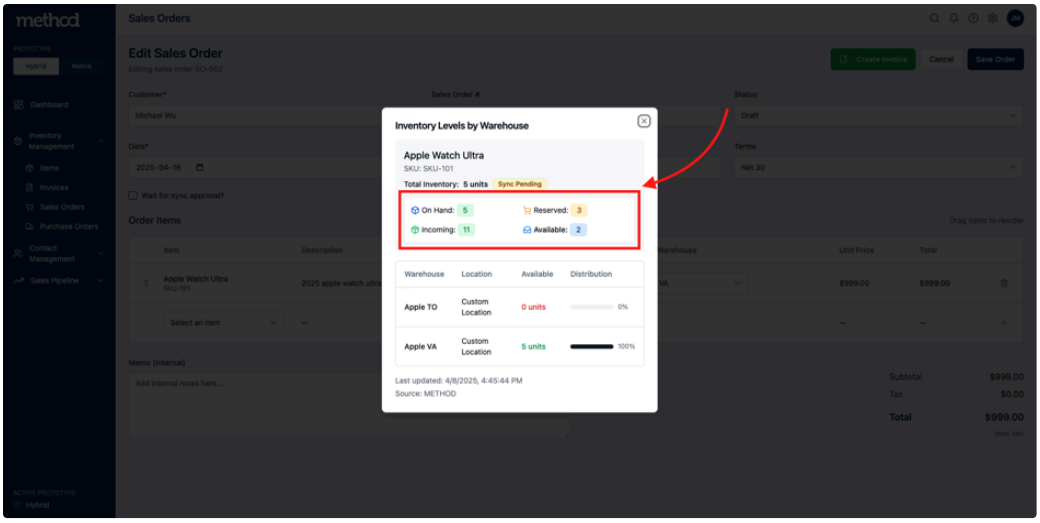
5. As a user, I want to see available inventory levels across all warehouses while creating or modifying transactions so that I can commit only stock that actually exists HIGH IMPACT LOW EFFORT



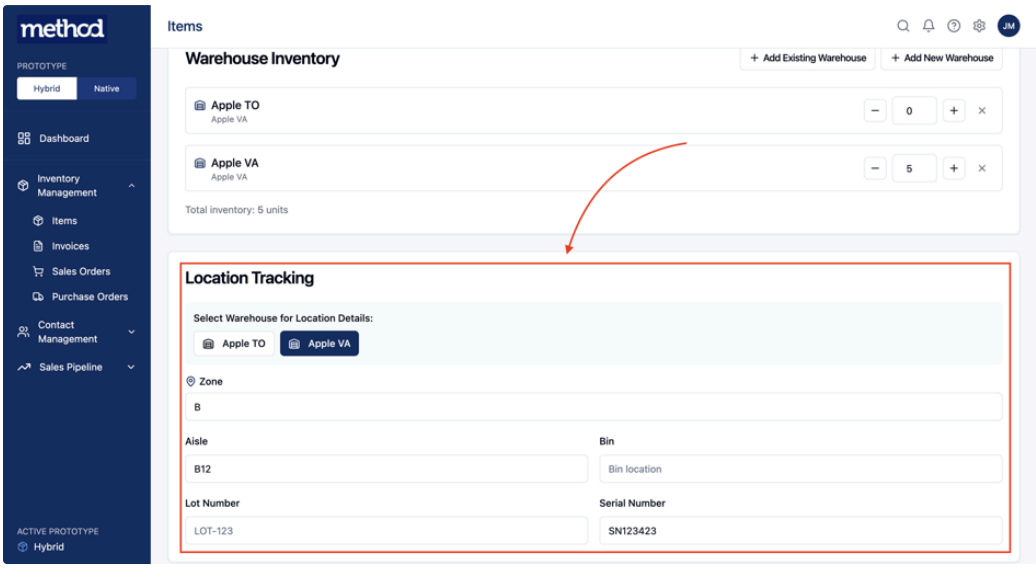


6. As a user, I want to see quantity on hand, quantity reserved on sales orders, quantity incoming on purchase orders, and available quantity (on-hand minus reserved) so that I understand true stock availability HIGH IMPACT LOW EFFORT

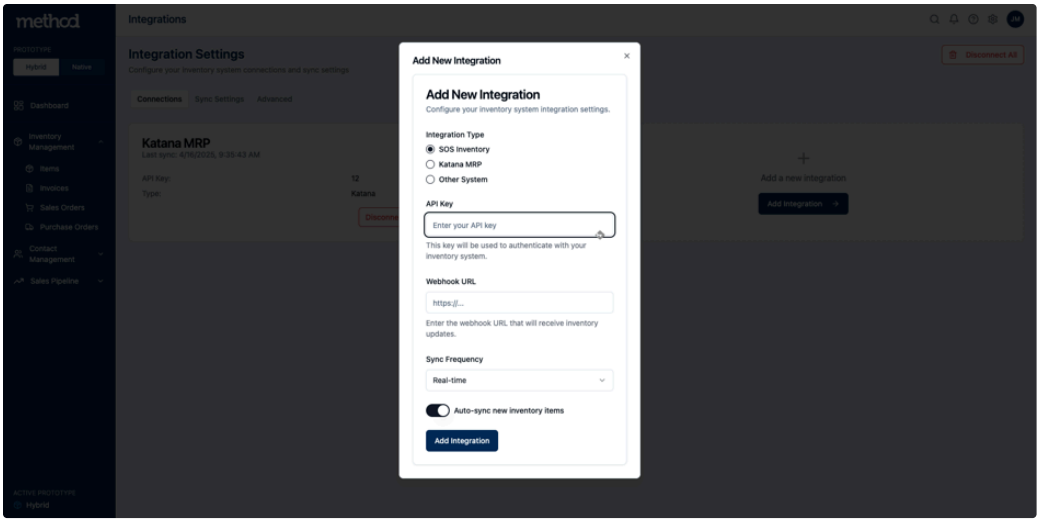




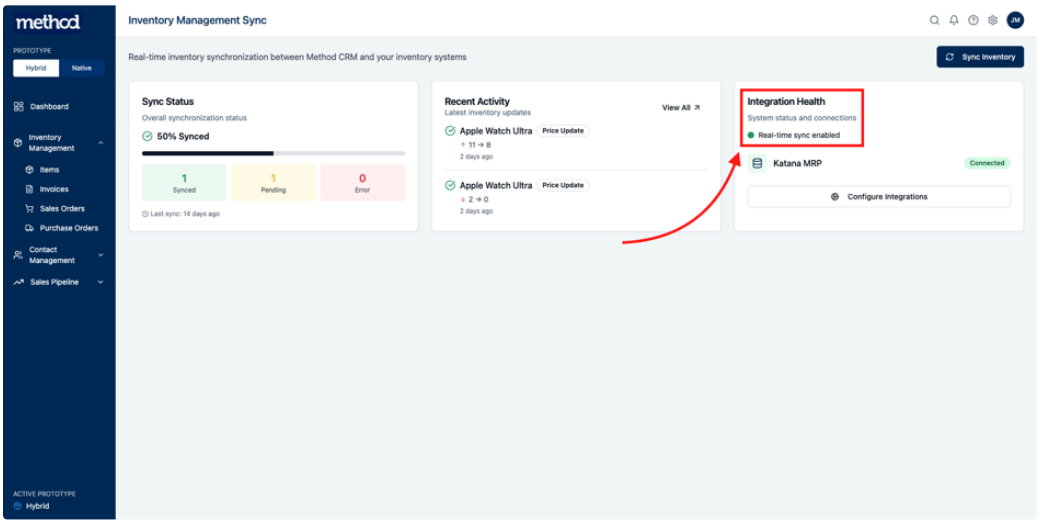
7. As a user, I want to assign zones, aisles, lots, and bins to each inventory record within a warehouse so that I can pinpoint exact storage locations HIGH IMPACT LOW EFFORT



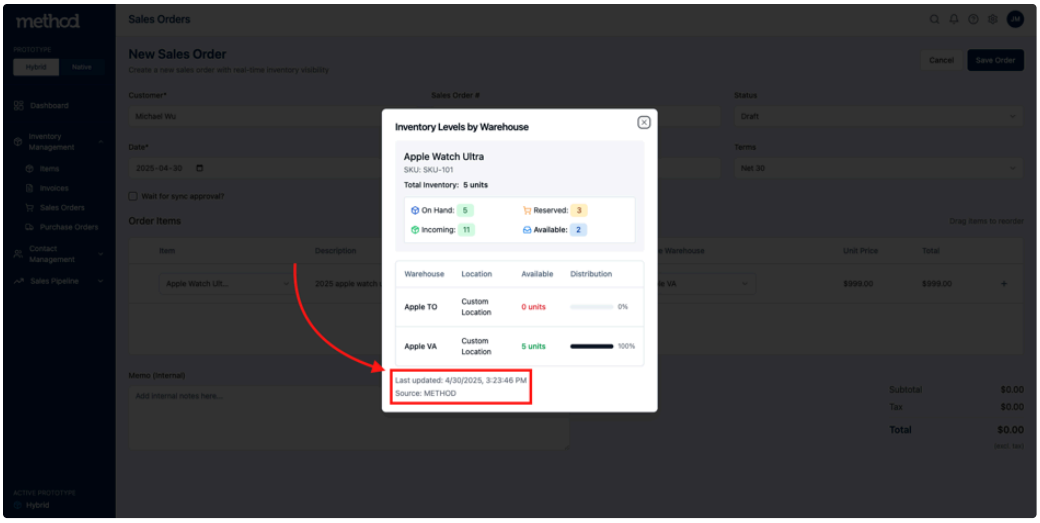
8. As a user, I want out-of-the-box easy integration with Katana so that I can avoid custom development HIGH IMPACT HIGH EFFORT



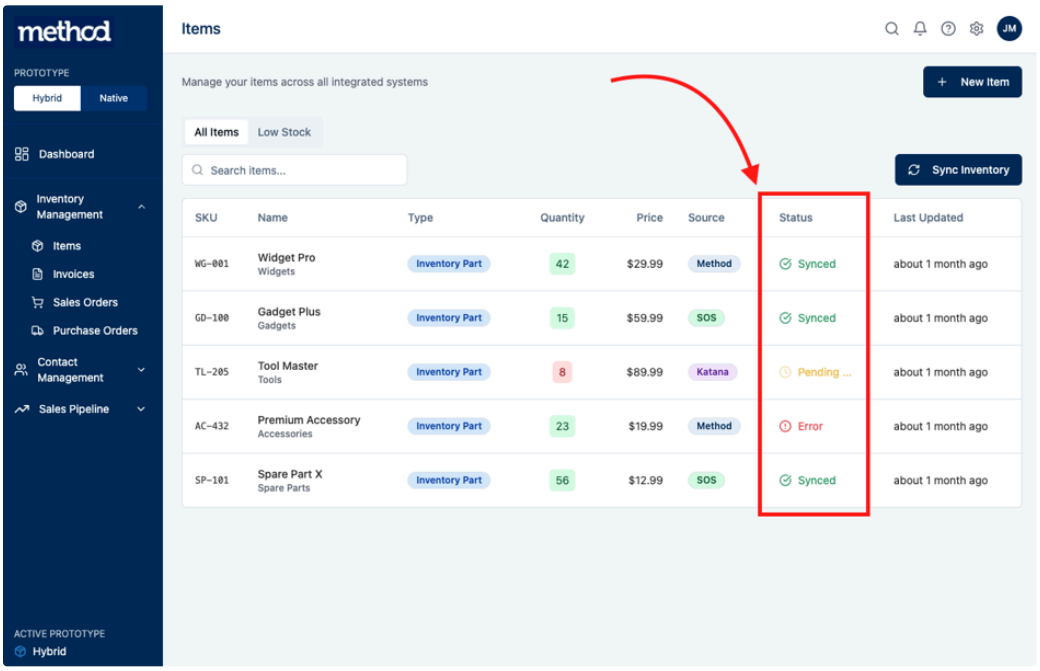
9. As a user, I want real-time two-way sync between Method and Katana so that both platforms always reflect the same data HIGH IMPACT HIGH EFFORT

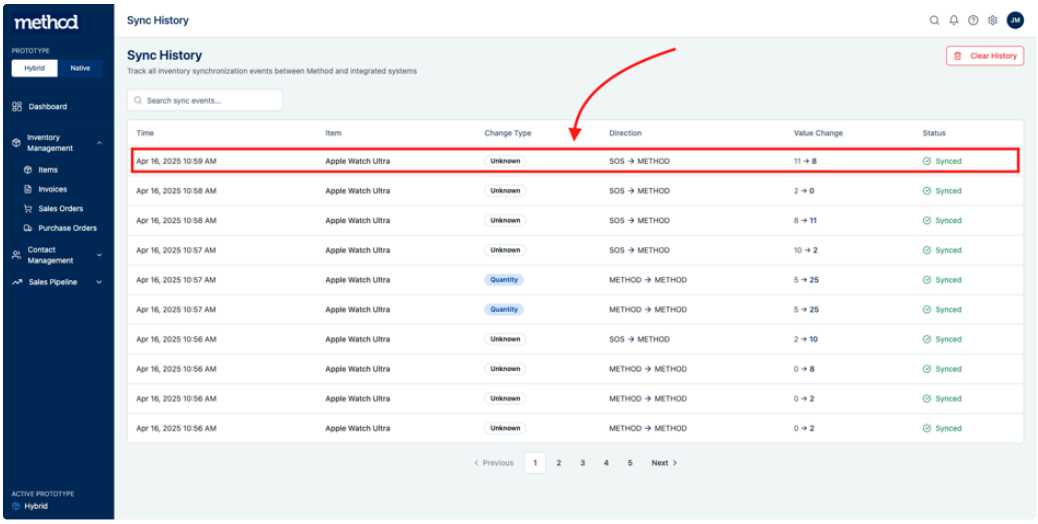


10. As a user, I want to see the last sync date for inventory quantities in a transaction so that I can trust the data is up to date and act with confidence. HIGH IMPACT HIGH EFFORT



11. As a user, I want real-time inventory count sync from Katana into Method so that my Method inventory view is always up to date HIGH IMPACT HIGH EFFORT

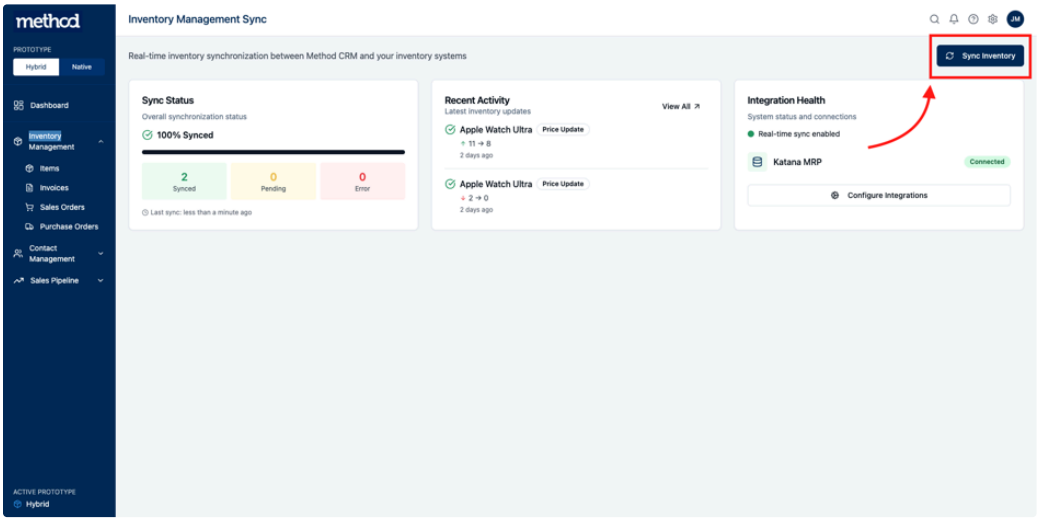




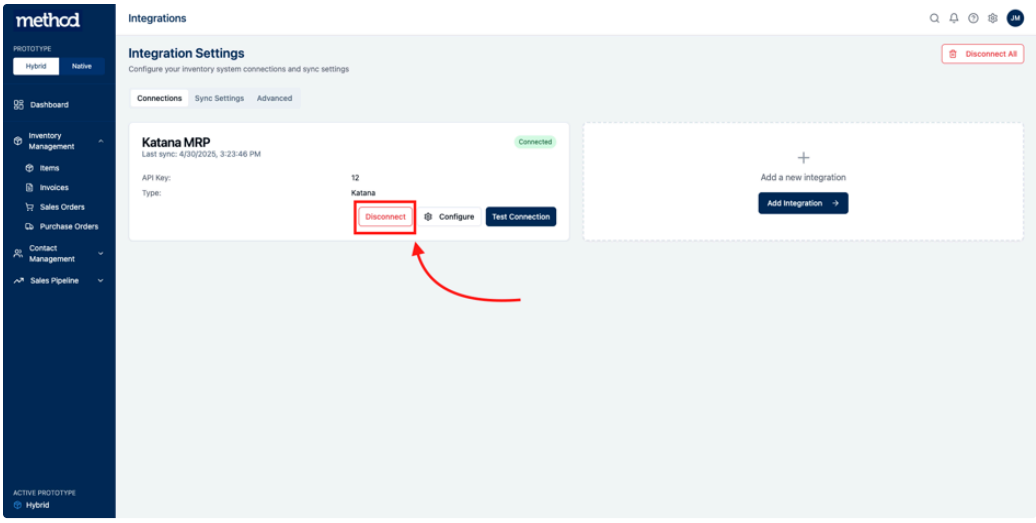
12. As a user, I want Method sales orders to import automatically into Katana so that orders flow seamlessly into my fulfillment system HIGH IMPACT HIGH EFFORT

Not currently shown on AI Future State Prototype

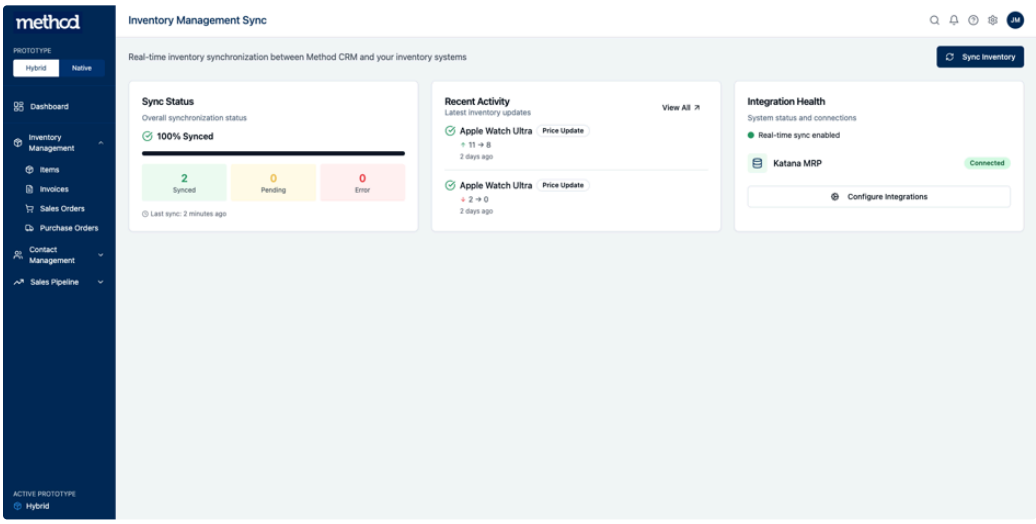
13. As a user, I want a manual sync button to trigger on-demand updates so that I can refresh data whenever I need it HIGH IMPACT HIGH EFFORT

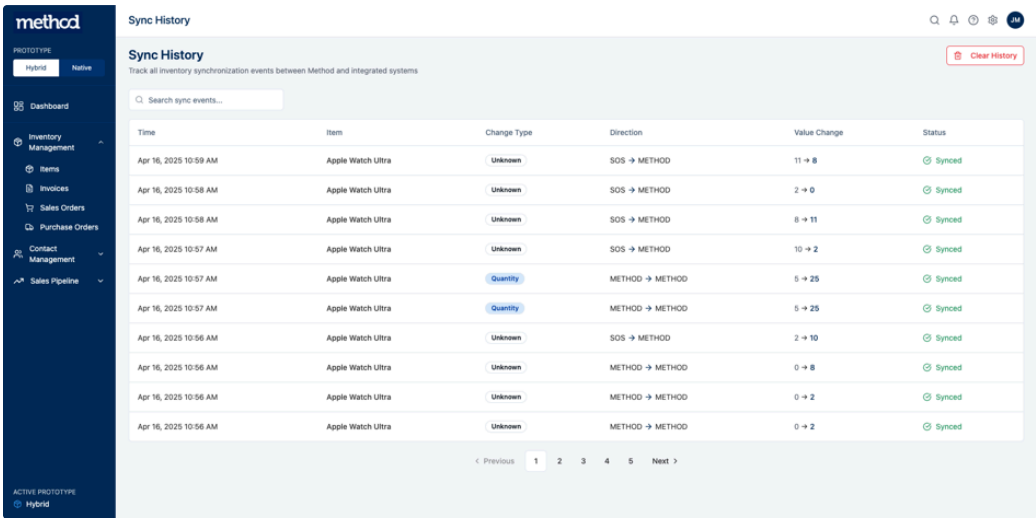


14. As a user, I want the ability to disconnect or remove integrations so that I can manage my connected systems easily LOW IMPACT HIGH EFFORT



15. As a user, I want a sync dashboard showing health, status, and history so that I can monitor and audit integration performance LOW IMPACT HIGH EFFORT

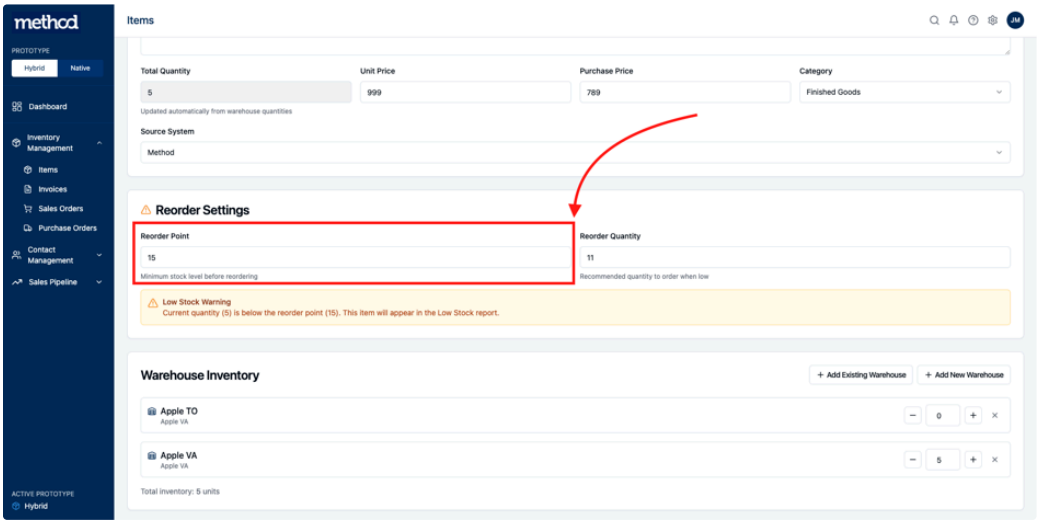




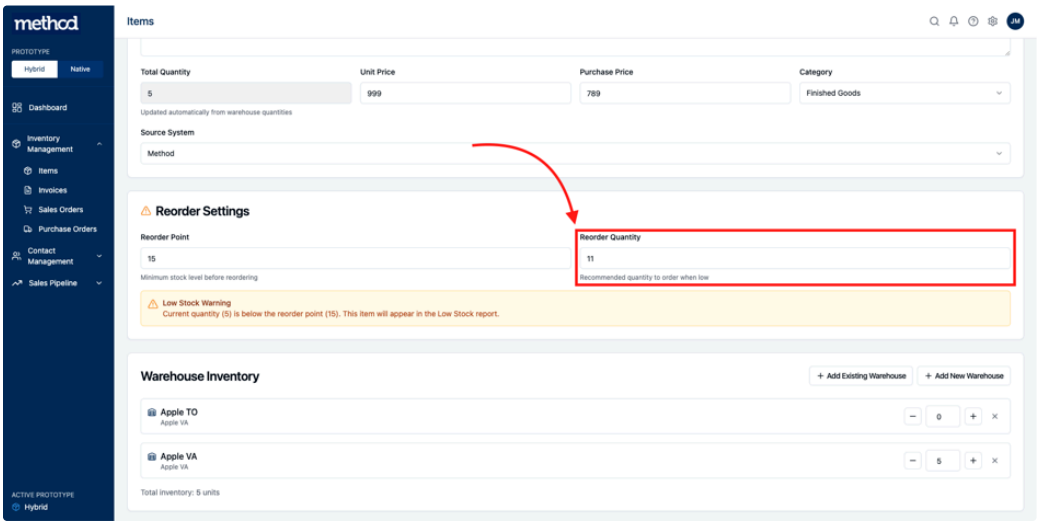
Batch 2:

Batch 2 focuses on improving inventory control and flexibility within core transaction workflows. These capabilities are important for a smooth user experience but are not blocking for initial inventory workflows—making them ideal for follow-up development after the MLP foundation is in place.

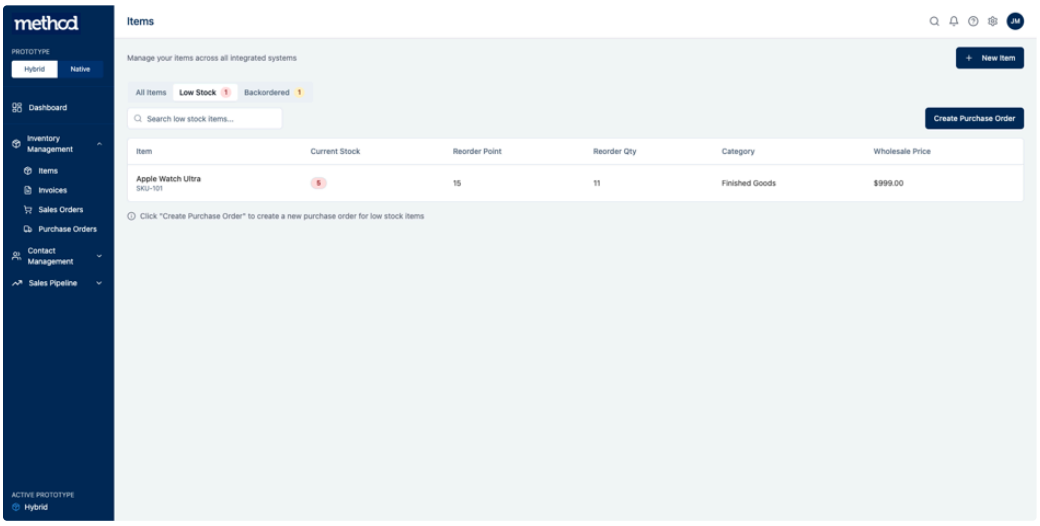
1. As a user, I want to set a minimum reorder point per item so that I know when stock falls below my threshold HIGH IMPACT LOW EFFORT

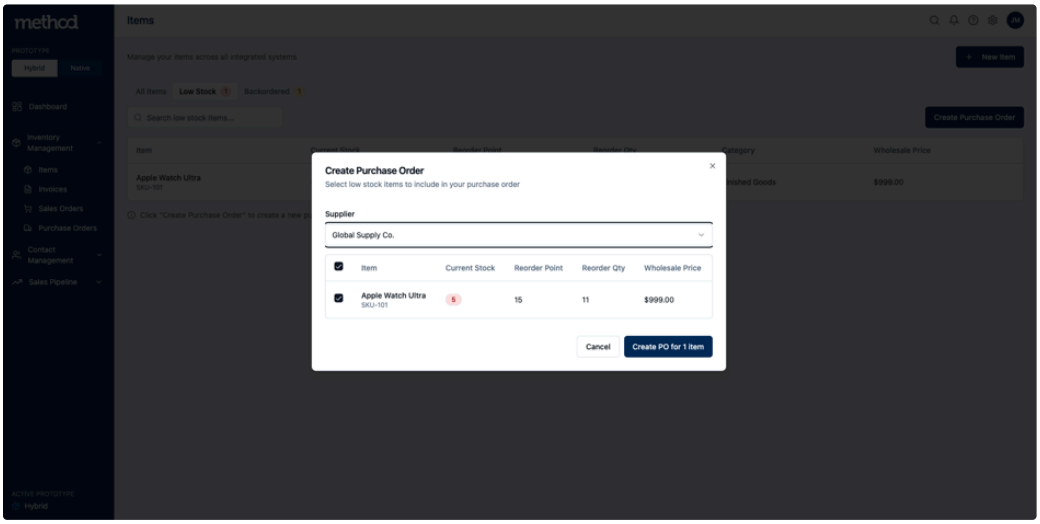


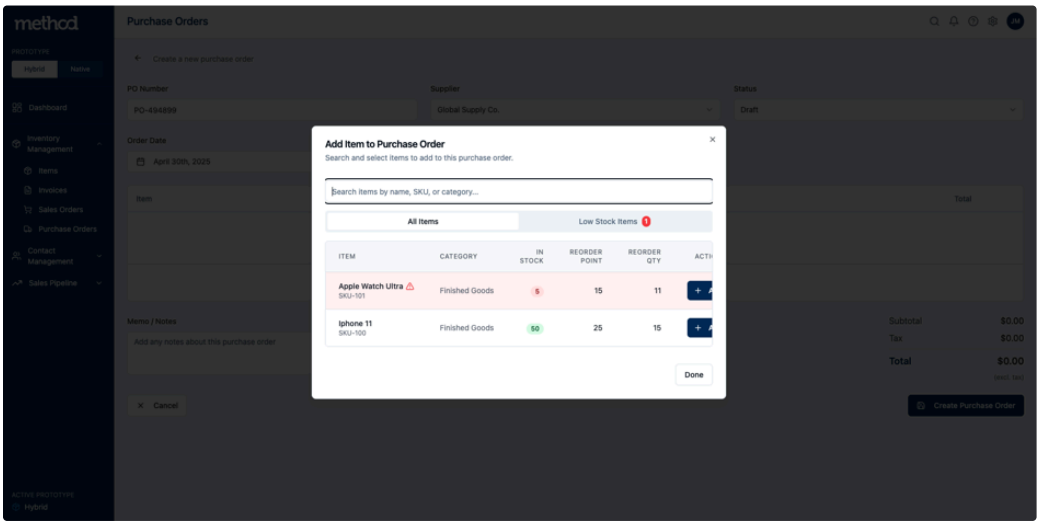
2. As a user, I want to set a minimum reorder quantity per item so that when stock is low, the correct amount is ordered HIGH IMPACT LOW EFFORT



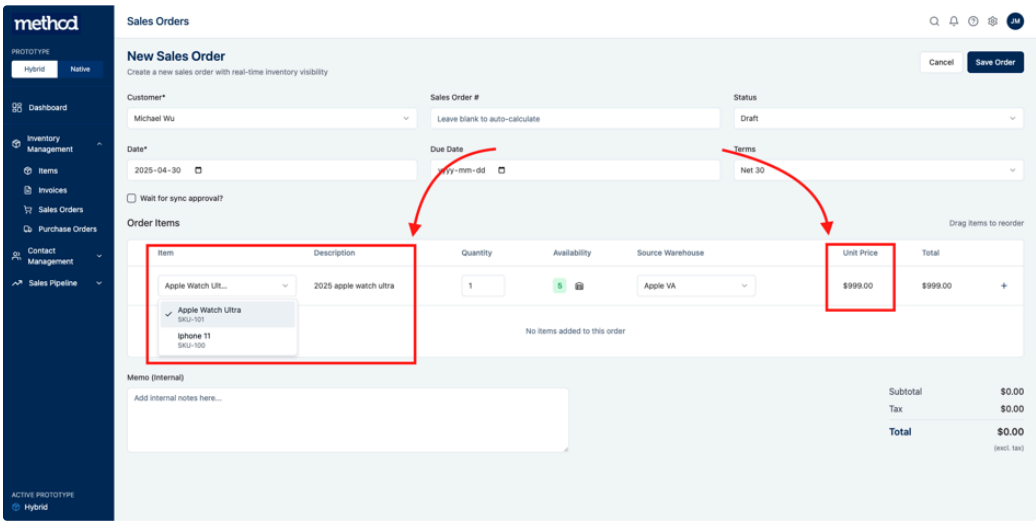
3. As a user, I want low-stock items highlighted in the Inventory Center with an option to create purchase orders so that replenishment is streamlined HIGH IMPACT LOW EFFORT



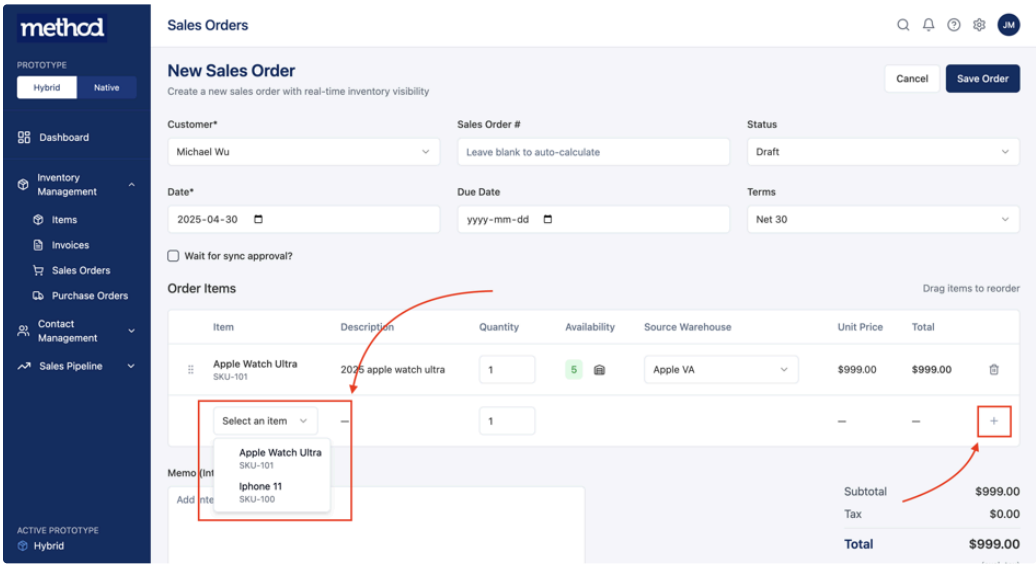




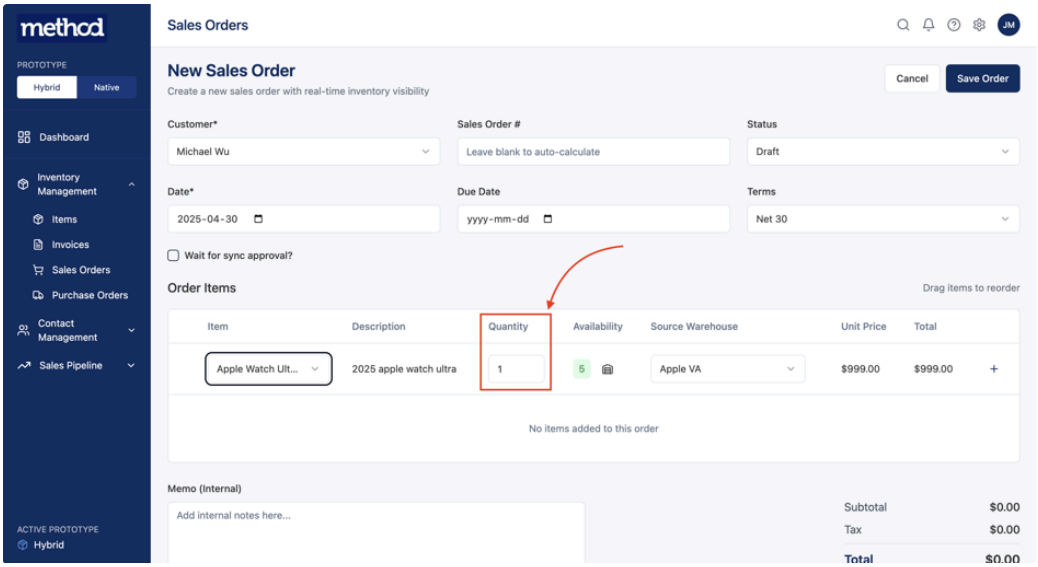
4. As a user, I can view all item details in a transaction including their SKU, name, description, and pricing details HIGH IMPACT LOW EFFORT



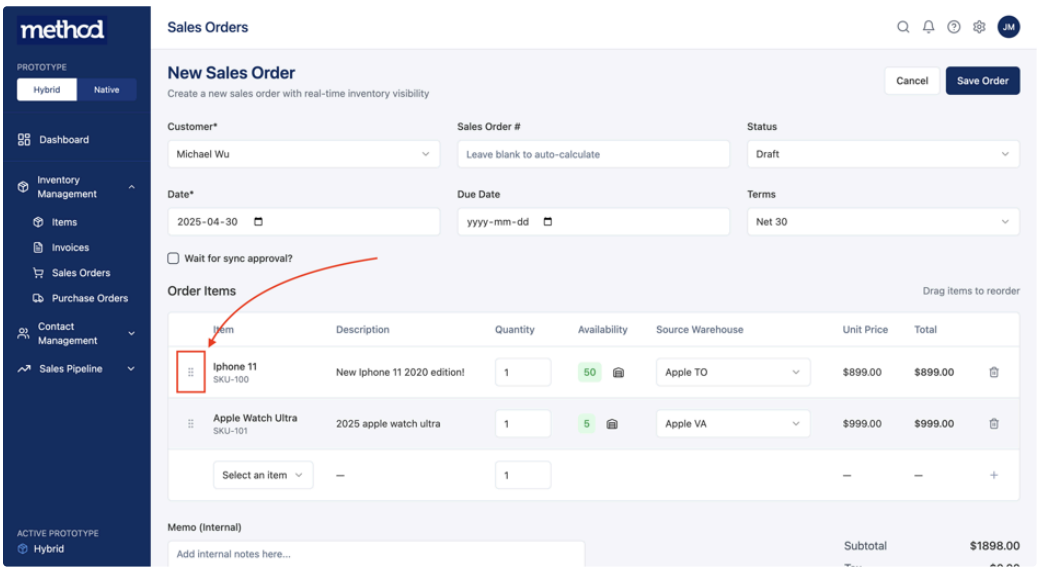
5. As a user, I can add new items to a new/existing transaction HIGH IMPACT LOW EFFORT



6. As a user, I can modify the quantity of items in an transaction HIGH IMPACT LOW EFFORT

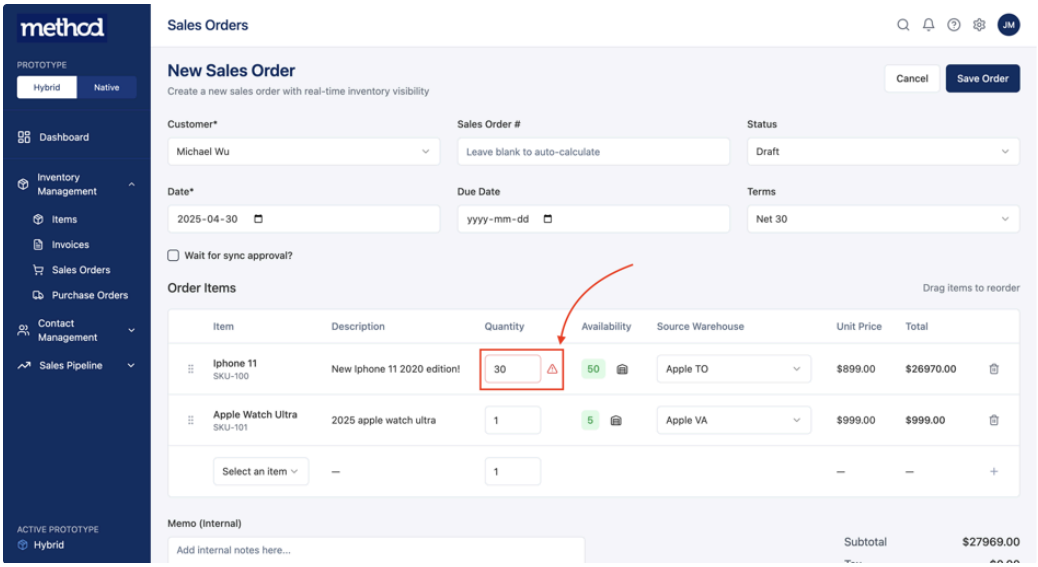


7. As a user, I want drag-and-drop editing for rearranging line items in all transaction types (invoices, sales orders, opportunities, estimates, purchase orders, proposals) so that I can easily adjust the order of items within my documents HIGH IMPACT HIGH EFFORT

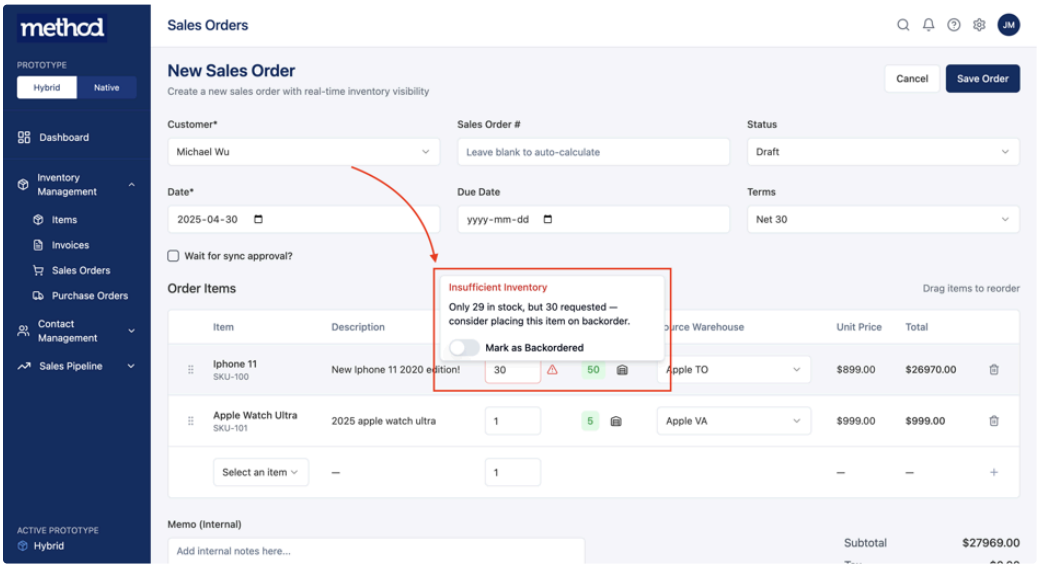


8. As a user, I receive warnings when requested quantities exceed available inventory

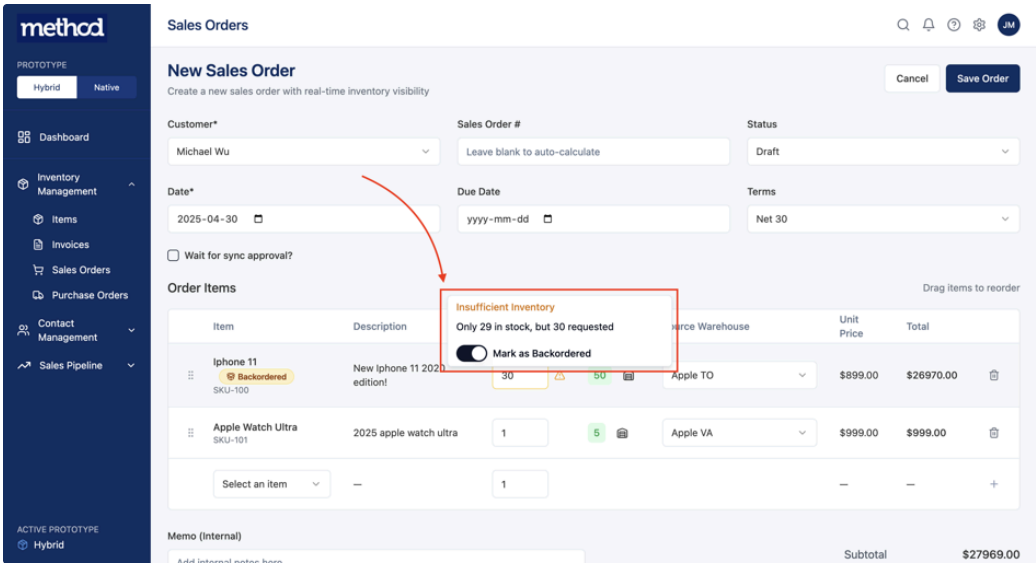
HIGH IMPACT HIGH EFFORT

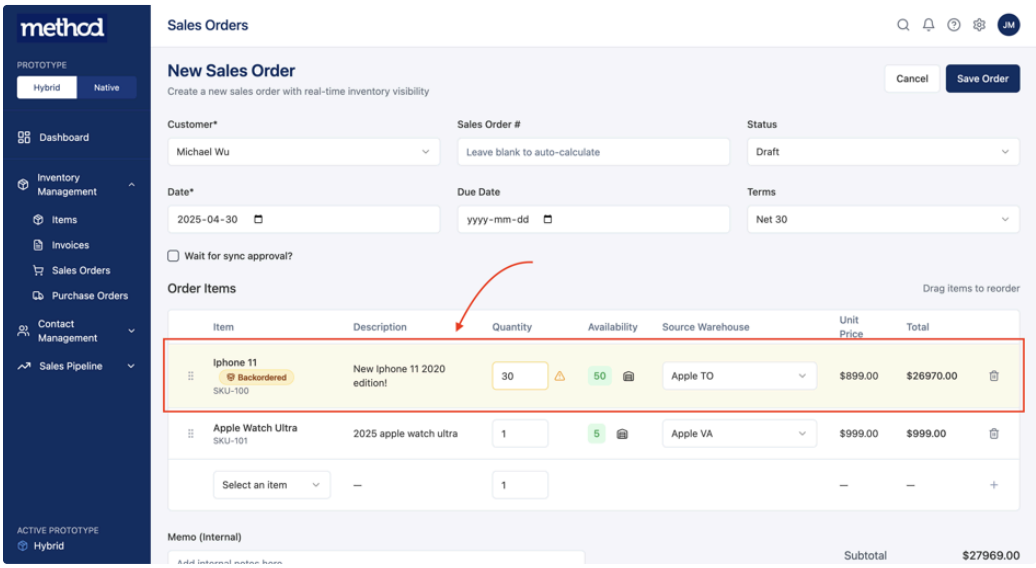


9. As a user, I want a clear warning when requested quantities exceed availability so that I'm prompted to consider backorders HIGH IMPACT HIGH EFFORT

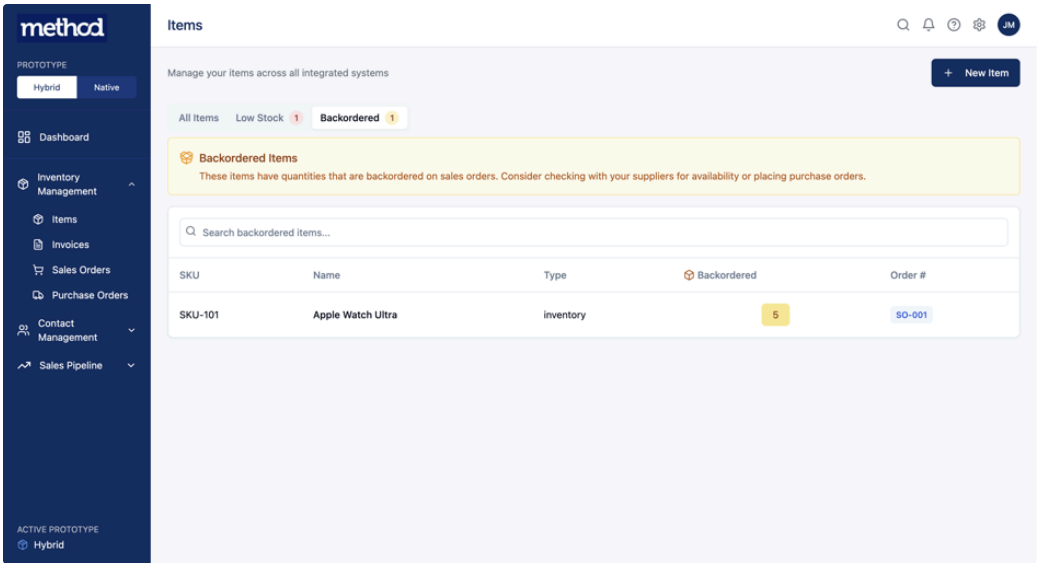


10. As a user, I want to flag a line item as backordered when stock is insufficient so that the order can still be saved and processed HIGH IMPACT HIGH EFFORT





11. As a user, I want backordered items to be tracked so that I can monitor them for future fulfillment LOW IMPACT LOW EFFORT



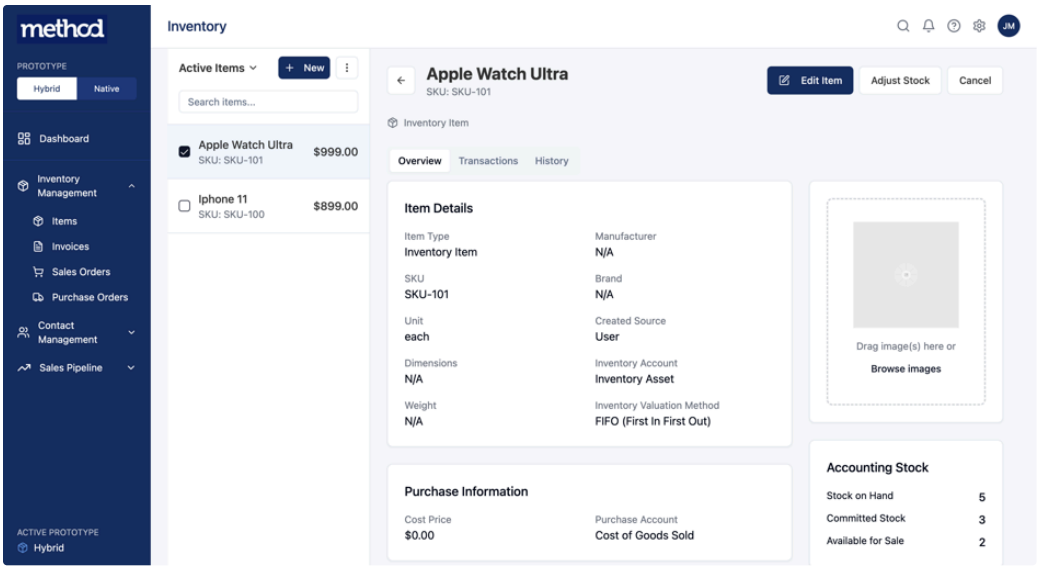
12. As a user, I want to manually update backordered sales orders when inventory is replenished so that I can proceed with invoicing and fulfillment LOW IMPACT LOW EFFORT

Workflow so no ss provided

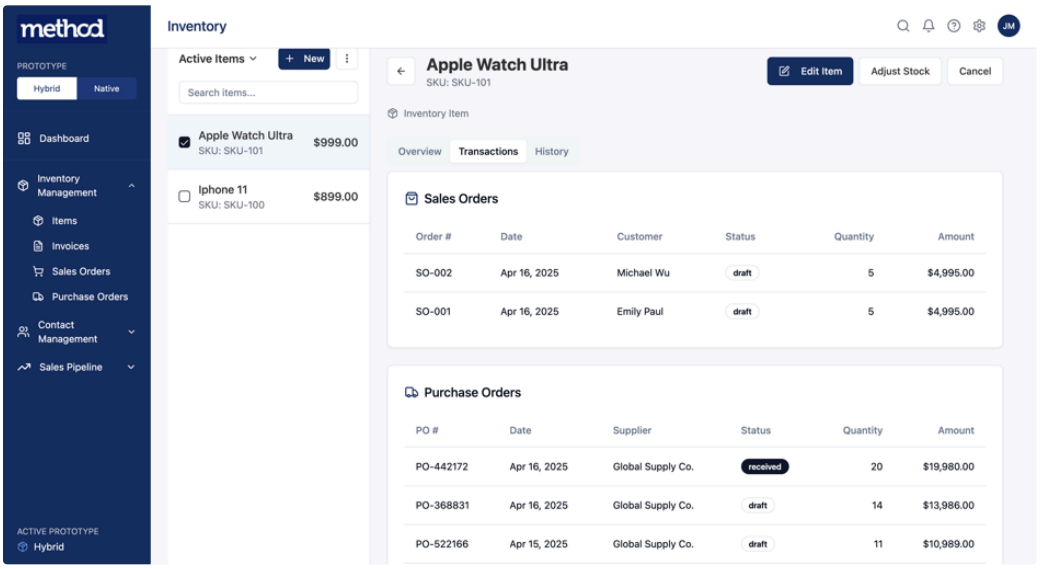
Batch 3:

Batch 3 includes features that improve transparency, and visual understanding of inventory but are not required for initial transaction or inventory flows. These enhancements are valuable for operational maturity and audit-readiness.

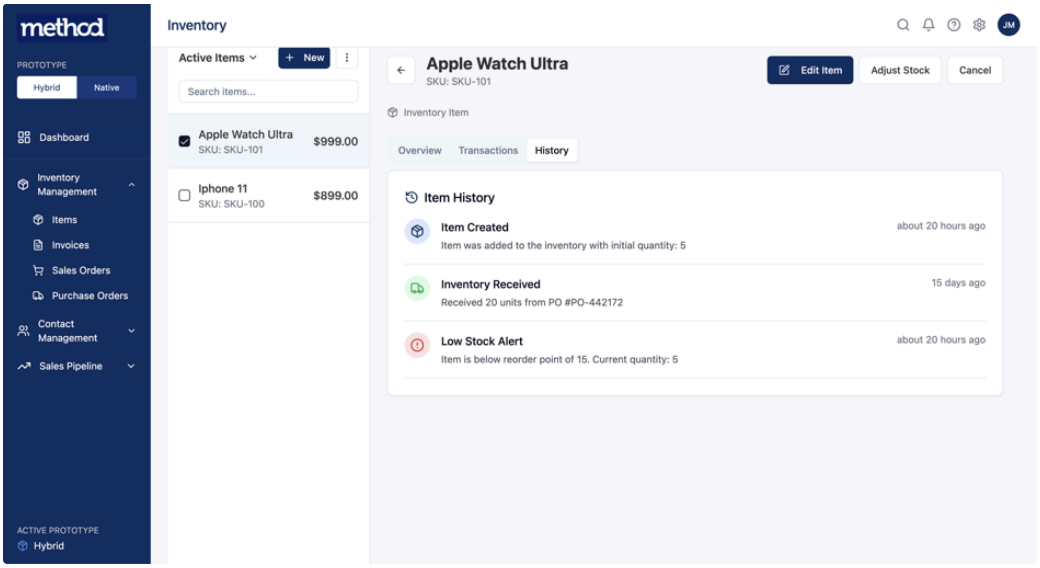
1. As a user, I want the full audit trail of an item's details (name, description, price, etc.) so I can review all changes over time HIGH IMPACT LOW EFFORT



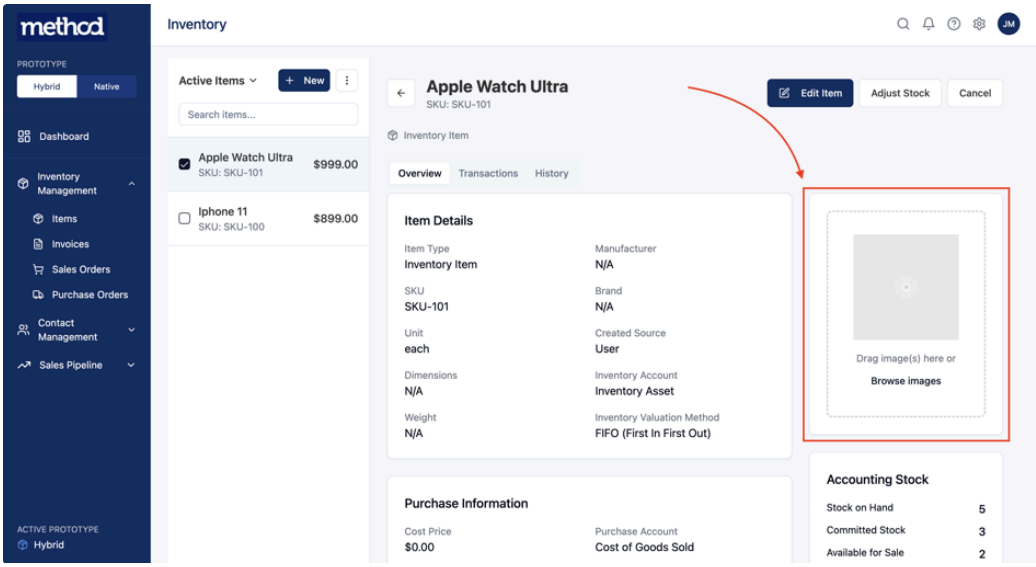
2. As a user, I want to view every transaction for an item (sales, purchases, adjustments) so I can trace stock movement and reconcile counts HIGH IMPACT LOW EFFORT



3. As a user, I want an item summary showing on-hand quantity, location breakdown, and recent changes so I can assess its current status at a glance HIGH IMPACT LOW EFFORT



4. As a user, I want to upload and attach one or more images to each inventory item so that I have visual references for accurate identification HIGH IMPACT LOW EFFORT



5. As a user, I want to update or remove item images easily so that my visual data remains current HIGH IMPACT LOW EFFORT
