Summary

John, the Product Manager for the Sales Management team, spoke with Eric from the Professional Services team to learn about the customizations Eric implemented for SLE Technologies. The discussion focused on understanding the customer's unique workflow challenges, the technical integration built with SOS Inventory, and Eric's perspective on future inventory management solutions.

Key Points Discussed

- **Customer Environment & Pain Points**
  • **Multi-Company/ Warehouse Setup:** SLE Technologies operates with seven companies under a single Method and QuickBooks account, sharing inventory across four warehouses.
  • **Inventory Visibility:** The primary challenge is that QuickBooks does not provide real-time, on-hand inventory data – especially showing exactly where items are located in different warehouses.
- **Custom Integration & SOS Inventory**
  • **Purpose of the Customization:** Eric built a solution using SOS Inventory to provide visibility into current stock levels and the specific warehouse locations.
  • **Integration Workflow:**
  – When a sales order is created in Method, a "view my warehouse" button allows users to see on-hand quantities per warehouse.
  – On saving a sales order, an API routine sends data from Method to SOS to update inventory levels.
  – The flow continues from SOS to QuickBooks Online, which then syncs back into Method. • **Update Frequency:**
  – The routine is scheduled to run three times a day, or it can be manually triggered via a refresh button.
  – Manual refresh routines can take two to three hours to complete, resulting in delays and potential discrepancies in real-time data. • **Technical Challenges:**
  – SOS's API documentation is difficult to navigate and lacks clarity, which has made initial setup and token management (key, secret, refresh tokens) challenging.
  – SOS always returns a list of items rather than a specific record, forcing Eric to loop through thousands of items (he mentioned numbers around 10,000, later reduced to improve performance).
- **Live Updates & Two-Way Sync Concerns**
  • **Current Limitations:** The system isn't live; inventory numbers are only updated periodically rather than in real time, which impacts decision-making during the day.
  • **Potential Improvements:**
  – A real-time, two-way sync between SOS and Method would be ideal, but this would require significant collaboration with SOS's API capabilities.
- **Future Prototypes & Strategic Direction**
  • **Prototype Options:**

1. **In-House ERP Prototype:** An out-of-the-box inventory management system within Method, offering advanced, native functionalities (favored by Eric for most customers).

2. **Integration Prototype:** Enhancing the current integration with SOS (and possibly other systems like Fishbowl) to streamline workflows.

3. **Hybrid Approach:** Combining basic native functionalities with optional integrations for customers who need more than the core features. • **Customer Preference:**

– Eric noted that most customers (especially those without an existing inventory system) lean towards an in-house solution, with a hybrid option as a close second.

• **Advanced Functionalities:**

– There was discussion about whether Method could eventually offer functionalities similar to QuickBooks Desktop (e.g., barcode scanning, more dynamic inventory tracking), though Eric emphasized that such an upgrade would require substantial development work.

- **Wrap-Up and Next Steps**

  • Eric agreed to provide further details or examples of other customer setups where these customizations are in use.

  • John expressed appreciation for the detailed insights and mentioned that this information will help inform the decision on which prototype to pursue.

Transcript:

Me: Hey, Eric. How is it going?
Them: Oh, give me one sec. I can't hear you.
Me: Afternoon. No worries.
Them: I can't hear you. One second. One second.
Me: Hello? Can you hear me? Can't hear you. Can't hear you now. It says you're on mute. Oh.
Them: What about now?
Me: I can hear you. Can you hear me?
Them: No. Yeah. I can hear you. Oh,
Me: Awesome. Awesome.
Them: sorry about that. Like, you're giving me issues. Okay.
Me: Yeah. No. No. It's it's it's it's all good. These things happen.
Them: Okay.
Me: But, yeah, I just wanna say thanks for joining me today. Like, you must be aware already. I'm John. Product manager. I'm leading the sales management team, and one of our big bets is, to ship a inventory management
Them: Okay.
Me: minimum lovable product. Right? And we
Them: Mhmm.

Me: completed a bunch of discovery and now we're in the prototyping stage. And we have a couple options that we have in mind for shipping this lovable product. But one of the things that we wanna understand is, like, what are our current customers' workflows, and how has the PS team, like, actually customized or solved those challenges or pain points. Right?
Them: Okay.
Me: After speaking to Asher, he mentioned how you actually completed a couple customizations. Pretty, like, deep ones for SLE technologies. And that's why I'm talking to you right now. I just had a couple questions to learn more about those customizations. So yeah. So I think, like, the first thing I wanted to know was, like,
Them: Yes. Sure. Would you like to go through?
Me: what was the specific challenges or pain points, SLE technologies, were facing that led to these
Them: Gotcha. So actually, it's a
Me: customizations. Yeah.
Them: bit of a special company. So instead of you know how we have multi tenancy?
Me: Yeah.
Them: And such in the system? SLA has the reverse of that. So there are currently seven companies within that one method and one QuickBooks account.
Me: Okay.
Them: Right? And what that's what those seven companies share is the inventory.
Me: Okay. Okay.
Them: Right? So they needed a way to keep track of inventory on hand across multiple companies and multiple warehouses.
Me: Mhmm.
Them: I believe we're up to six or we're up to seven companies and four warehouses. Right?
Me: Yeah.
Them: So the pain point was that QuickBooks doesn't really tell you how many you have on hand at that moment.
Me: Mhmm.
Them: And it really does not tell you
Me: This quote was from mine. Right?
Them: where it is at the moment. And so Yes. QuickBooks on it. Exactly.
Me: Okay. Mhmm.
Them: And SOS was the solution to that. Right? So what I built in SOS is the ability to view on hand quantities of items, right, and the ability to see which warehouse they're in. Right?
Me: Got it. Okay.
Them: So one more thing is that it's not completely perfect. Another pain point that I'm unable to solve that would be nice if, you know, Hugo you guys can possibly do it, was that it is not completely live, so to speak. It's not completely, like, accurate. Because it is based off a app routine. It gets run three times a day. Right? But what my customer has asked for in the past is, like, a live update. So for example, if something were happened to SOS, it would shoot into Method. If method were to sell something, it would shoot back into SOS. Right? Unfortunately, that is not the case.
Me: Got it. So these updates only happen three times a day basically.

Them: Yes.
Me: I see. Okay. So
Them: Or when or when clicked. Or when, like, or, like, when I have a I have a button that calls routine to do this update. But this update takes
Me: Got it.
Them: two to three hours, and an item could have been sold or moved at that point.
Me: Got it. And is these buttons, like, Scott's manual refresh override, Scott's manual refresh,
Them: Right.
Me: yeah. Those those are the buttons to override and, like, manually refresh the inventory levels. Right?
Them: Correct. Correct. Right. And if you look into them, they call a routine, which is very, very long.
Me: Okay.
Them: If you want a little did you want me to go through, like, how that routine works? Okay. Sure.
Me: Yeah. Yeah. Please. Yeah. That'd be awesome.
Them: Okay. Give me a second then. Let me see if I can
Me: Sure.
Them: share my screen. Give me one quick sec.
Me: And, Moores,
Them: And Okay. Moving over here. Gonna bring it up. Are there any other questions while I bring this up?
Me: Yeah. I think, like, so you mentioned how, like, you integrate an SOS integration with Metabase. Right? And the primary purpose of this integration
Them: Yes.
Me: is to, provide real time, inventory stock levels across the both platforms. Right?
Them: Yes.
Me: Okay. And how is this customer utilizing SUS inventory versus how are they using method, like, for inventory right now? Like,
Them: Then what contacts?
Me: is, SOS inventory their main inventory management platform? That they're using, or is Method that current platform?
Them: It is a kind of a combination of the both, so to speak.
Me: Okay.
Them: Right? So for example,
Me: Mhmm. Yeah.
Them: how it works exactly
Me: Yeah. Like, maybe you can, like, talk to me about the workflow and how, like, the
Them: is that that
Me: flow from method to SOS for this specific customer.
Them: Okay. So
Me: Yeah.
Them: what happens is that we, for example, they saw if they'll create a invoice
Me: Mhmm.

Them: in method, for example.
Me: Yeah.
Them: Right? They'll create an invoice in method. Right? And they'll want to see
Me: Mhmm.
Them: how many we have on hand. Right? I guess this is not a not not invoice. Let's say sales order. Sorry. So for example, this loads. I have this cool buttonhole. It's like it's v a b w, which means
Me: Mhmm.
Them: view my warehouse. Right? So when I click into it, I can see which warehouse it's in and the quantity available. Right? So that, you know, in case they can call the, you know, call that certain warehouse, be like, please give me x number of items that I need them. Right? For example. Right? So what happens next is that on save, right, this gets updated to SOS inventory. What I mean by that is that, like, when I save this, right, this, sorry. There's another customization on top, not just for inventory, but sending the actual sales order to SOS to remove that item from stock. Right? So this is not really this is kind of, but not really part
Me: Got it.
Them: of your inventory system? Excuse me. But it was one way of trying to keep the user in method instead of them having to go into SOS. Right? So I have an API on save that just sends this
Me: Mhmm.
Them: to SOS and removes it from the inventory. Right? And then from SOS, they'll sync to QuickBooks.
Me: I see. Okay. Okay.
Them: Yeah. So the flow is, like, method to SOS to QuickBooks, and a QuickBooks will send us information back. Right? So right? So it's it's three programs working together.
Me: Got it.
Them: That's why there's, like, a delay here and there.
Me: Got it. Got it. And, like, the sort by warehouse, like, inventory by warehouse,
Them: Right? Yeah.
Me: that's from, SOS, though. That's being synced from SOS. Right?
Them: Yes. Yes.
Me: Got it. That that
Them: Ma,
Me: real time based on those three times a day, it's getting updated. Got it. And, so
Them: Exactly. Yeah. Yeah. Yeah.
Me: basically, the flow kind of stops at sales orders in method, and then the sales orders get synced to SOS inventory, gets updated, then it syncs
Them: Yep.
Me: with QuickBooks online, updates and flex in method.
Them: Yes. Eventually. Yeah. So
Me: Eventually.
Them: like a circle. Yeah. Yeah.
Me: Okay. Got it. Got it. So, there is a multiple customizations you
Them: Yeah.

Me: did. You did not just did like those, those buttons or
Them: Yeah.
Me: SQL integration but also like this view by inventory level. Like, view by warehouse.
Them: Yeah. Yeah. So it's it's it's quite heavy.
Me: I Okay.
Them: But let me let me actually go through what it takes to do this so you have a better understanding.
Me: Yes. Yeah.
Them: Understanding. So let's look at my items app. So for example, another thing that well, it's not yearly, but I have to I have to run it multiple times per day because I can't know, make it run for once just once. Right? But for example, let's just go to the main one. So with SOS, the we have something called, like, the do you know what the API tokens and refresh tokens and access tokens are?
Me: I know what APIs are, but
Them: Okay.
Me: I the rest, no. Not really.
Them: Sure. Sure. So what happens is that to access, SOS inventory, you need a key or secret Right? And that key or secret is only valid, I believe,
Me: Mhmm.
Them: for ninety days or eighty six days or something like that. Right?
Me: Mhmm.
Them: So what happens is in this first part of my routine, I check if my current key is still
Me: Mhmm.
Them: valid. If my key to the system is not valid, then I create a new key, so to speak, to access that inventory information.
Me: Okay. Mhmm.
Them: Right? So then what I do next is fairly simple, is that I would go into, my first sorry. My first action is to check how many items are in SOS inventory right now. So someone has to set up these items ahead of time.
Me: Mhmm. Mhmm.
Them: Right? So there has to be a a bit of maintenance between two two accounts, both the QuickBooks
Me: Mhmm.
Them: and SOS and method. Right? But, ideally, if the item is created in SOS, it gets moved over to QuickBooks, and therefore, us
Me: Yeah.
Them: therefore, we there shouldn't be any discrepancies because of because of our syncing. But
Me: Okay.
Them: right, but nevertheless, I still through this system, I have to check how many active items exist in SOS inventory, and
Me: Mhmm.
Them: what I do right, is that I get
Me: Mhmm.

Them: the total number of items that exist. And using that total number of items, right, I create a counter loop.
Me: Mhmm.
Them: Right? So it's like a a special type of that goes through every single item
Me: Mhmm.
Them: in the inventory. Right? And what I do is that I just take the quantity on hand, right, and I update a custom field in method right, to tell me, you know, how much quantity is on hand for that specific that specific item. Right? So that that's it's it's fairly simple.
Me: Okay. Mhmm.
Them: Right? It looks complex, but it's just check that item, check the check the inventory, and then upload it in the method. Right?
Me: Yeah.
Them: The only issue is that I there's a lot of items. There's, like, 10,000 items So this routine takes, like, quite a long long time to run. Usually, it used to
Me: I see. Wow.
Them: it used to take six hours a day. Now it's down to
Me: Mhmm.
Them: two because I've asked them to reduce the number of items. Right? So that that's the first routine. The second routine is just really, really is really similar. Right?
Me: Mhmm.
Them: It's just the location one by breakdown. Right? So it's more or less the same routine, but I add a little bit more to it. Right? I loop through I go through all the locations that are available in method first. Right? And then and then after that, I do the exact same routine
Me: I see. Okay. And you mentioned
Them: Right? But only by specific location. Yeah. Yeah.
Me: locations available on method. This is, customized. Right? Like, because currently, we can't filter by a location. Right? Or can we?
Them: No. We we we can't filter by location.
Me: No.
Them: In in method. So what I've done is that location is available through QuickBooks and method.
Me: Yeah.
Them: Right?
Me: Mhmm.
Them: I've taken that data, just taking the plain text values of that data
Me: Got it.
Them: right, and use that to retrieve from SOS. Because SOS
Me: Yeah.
Them: can sort by location. We can't. And QuickBooks can as well. Right? But we
Me: Yeah. We can't. Okay.
Them: we can't. Yeah. Exactly. Sorry. QuickBooks can't, but it hasn't available. Right?
Me: Mhmm. Mhmm.
Them: But SOS uses that location to sort the items.
Me: Yes.

Them: So I'm kinda bypassing QuickBooks and looking to SOS
Me: Mhmm. Got it. Okay. Makes sense. Okay.
Them: to grab that location for me. Yeah. Yeah.
Me: Mhmm.
Them: You have any questions about that or just how it works or
Me: Yeah. No. That that that that makes sense. So, my understanding, what I'm getting at here for this specific customer, managing inventory by, like, warehouse and location is extremely important for them to complete their workflow. Right?
Them: It it used to not be.
Me: Yeah.
Them: It started out with just
Me: Okay.
Them: knowing the most important thing was knowing the inventory on hand. Right? That was the initial build.
Me: Yeah.
Them: But then the company grew.
Me: Got it.
Them: Right? And at that growing moment is when we needed it by location.
Me: Got it. Got Got it. Got it. So initially, it was just based on, like, the visibility, the SOS integration. That was the most important thing.
Them: Yes.
Me: Got it. Okay. And,
Them: Yeah.
Me: was there any specific, like, challenges with, like, integrating with SOS
Them: It is
Me: initially? Or is it,
Them: It is a pain in the ass to set up.
Me: pain in the ass? And what are what are, like, your pain points with the integration side?
Them: So document like, doc first off,
Me: Okay.
Them: SOS's documentation was very difficult to read. It was really like, it just for example, I had another fellow consultant who also did this. Right? And it took both of us five hours each just to get through the documentation and understand how to initial that key part I was talking about, of where to get the initial key
Me: Mhmm. Mhmm.
Them: where to look for the specific data. Right?
Me: Yeah. Mhmm.
Them: SOS has very poor documentation when trying to do this, unfortunately.
Me: Got it. Okay.
Them: Right?
Me: Mhmm.
Them: The other pain point that I face is that SOS doesn't give you a clear or easy way to look at one specific item or one specific record. SOS will always, always give you a list I have never like, I've still not to this day, I'm still not able to figure out how how ask to ask SOS to give me

one specific item. Right? It will always try to fuzzy match for me and always try to give me a list. So that's why I you see that I have to run through of over 10,000, 6,000, you know, 2,000 items.
Me: Yeah.
Them: Right, at a time. Right? So those were sort of the pain points. And last but not least,
Me: Mhmm. Mhmm.
Them: the biggest pain point that my customer brings up, but I I guess he they have to live with it for now, is that it's not live. Again, there's just there's this really there's this really big delay where, you know, I gotta wait a couple hours or I gotta click this button right, to figure out whether I have inventory or not. Right? So at, like, at 5AM in the morning, you they'll know the number is accurate.
Me: Mhmm.
Them: Right? At 12PM, they hope the number is accurate.
Me: Yeah.
Them: Right? And at 6PM, they know the number's accurate again.
Me: Yeah.
Them: Just because everyone stops selling at that time. Right?
Me: Got it. I see.
Them: So that little time frame of just, like, inconsistency, uncertain is kinda painful. Especially during the day, especially when they're trying to decide
Me: Mhmm.
Them: we buy this item? And I take this item from the other warehouses? Right? So that's one of the things that's sort of a struggle.
Me: Got it. And, is it realistic to imagine that we can get to that point where it can be live?
Them: That
Me: Like, I I
Them: That really, really would depend on SOS's API with method.
Me: Nice. I see.
Them: Right? I there would be half there would have
Me: Okay.
Them: to be some sort of other developer on the SOS side right, to configure methods API so that SOS can send information
Me: Got it.
Them: to method. Right? So that we have a two way sync.
Me: Mhmm. Yeah.
Them: Just like our sync engine. Right?
Me: Got it. Mhmm. Mhmm.
Them: I never explored that concept.
Me: Mhmm.
Them: To be honest. So I might give you with a % certainty that's a no or a yes.
Me: Yeah. Yeah. Got it. Okay. And,
Them: Right?
Me: this is just one customer that you completed this type of integration, these types of, workflows. Is this similar? Is this pain point reflected in other types of customers? Who also want, like, inventory management solutions as well?

Them: I I would take my opinion with a grain of salt.
Me: Okay.
Them: But for the majority of my customers, Yes. Right? Just the the biggest point is, like, I want to know
Me: Yeah.
Them: what my inventory level is right at this moment.
Me: Got it. Mhmm. Mhmm.
Them: Right? That that delay between the inventory system is, like, what cost them money, so to speak.
Me: Makes sense. Yeah.
Them: Right? Well, what what will cost that deal? Right? That was the biggest point I would point out
Me: Yeah. Yeah.
Them: The everything else is sort of just superfluous. Right? It'd be great if, like, for bigger enterprise level companies, I would say emphasize that, like, maybe the warehouse thing is a little bit more important, especially if you wanna if we wanna
Me: Mhmm.
Them: this towards our bigger customers. Right? If they're multiplying if they're sorry, if they're managing
Me: Mhmm.
Them: a customer or franchise with multiple locations, right, That might become an actual issue with them. But I think the main point
Me: Mhmm.
Them: right, is the live thing. Right? Making sure that it is accurate at the moment they look at it.
Me: Got it. And, like, right now, we're just speaking about SOS. Would you say SOS is the most, prevalent, like, integration that most customers will look forward to they looking at other types of integrations with other IMS software like Katana or stuff like that?
Them: I can't give you a clear answer on that. Sorry. The the only experience I have
Me: Okay. Yeah.
Them: is with SOS. I've also heard fishbowl
Me: Fishbowl. Yeah.
Them: been tossed around. Just just those two mainly.
Me: Mhmm.
Them: But I can't say, you know, which one is the best or which one our customers prefer to be honest.
Me: Makes sense. Okay. So I think I got a better understanding of
Them: Yeah.
Me: this customization along with the workflow. Sorry. There's just one thing I'm trying to wrap my brain around right now. Right? So, like, they these customers, they use another platform that's you know, has more advanced features like SOS, right, to manage all their inventory
Them: Yeah.
Me: track everything on hand. Right? So
Them: Yeah. Yeah. Yeah.

Me: That that's the primary reason why they're using this system. Right? But they wanna connect it to their CRM so So while they're doing managing their pipeline, going through, like, different transactions with different customers, At that point in time, they can see their inventory levels, what they have on hand, if they have to reorder, and so on. So they don't have to keep going back and forth between both softwares. That's like that's like the core ideology between connecting the two, right?
Them: Yeah. It's yes. And, also, what I think is that it's you're able to come to a decision faster
Me: Yeah.
Them: right, instead of calling people. So for example, you're trying to strike a deal
Me: Yeah. Yeah. Yeah.
Them: with a customer. You're wondering how this inventory is on hand or if it's available by warehouse somewhere.
Me: Yeah.
Them: Else. Right? You know? Instead of going in like, searching SOS, like, for number one, you would have to
Me: Mhmm.
Them: buy another license for that inventory software. Two,
Me: Mhmm. Mhmm.
Them: you have to teach that person to use that inventory software. Right?
Me: Yeah. Mhmm.
Them: Three, right, then that person has to search and that we that's gonna eat time. Right? Search up that inventory, make sure it's the right, verify it. Right?
Me: Mhmm.
Them: And then and then also tell the warehouse, say, I'm going to take this item.
Me: Yeah.
Them: Right?
Me: Mhmm.
Them: All that is time time and money. Right?
Me: Mhmm.
Them: So by putting it into method,
Me: Got it.
Them: we save them back.
Me: Got it. And make the entire process seamless, easy, and quick so that
Them: Yeah. Exactly. So, like, you know, you're calling about, do you have any bypass drivers? So, like,
Me: that
Them: oh, okay. No. You don't have any. I only have a this warehouse. Therefore, I know not to sell it. Right? For example. Right?
Me: Got it. Mhmm.
Them: Just saving them time and money. That's that's that's that probably have those integrations. Yeah.
Me: Yeah. Yep. Yeah. Got it. So, like, sorry. I just wanna confirm So when you're in the sales orders and you, like, view by like warehouse, are you able to select by which warehouse you wanna the items to, deduct from? Or no? No. No. No.

Them: No. No.
Me: Okay.
Them: No. You're not able to. That's all
Me: SOS.
Them: John SOS. Right?
Me: Got it. Got it.
Them: It's like For example, I think I have this here, but maybe not. But, like, there is location. Right?
Me: Mhmm.
Them: On SOS.
Me: Mhmm.
Them: Right? I'm pretty sure that I've updated this button to also send the location of the specific customer. To SLS.
Me: I see.
Them: But they haven't they haven't really asked you to pick which warehouse. Right? So that might come in the future, but that is possible.
Me: Oh, okay. Okay. So in the in the back end, it's like, whatever's on hand is where it's
Them: Right? Yeah.
Me: gonna be, this is just more confirming that we have the quantity on hand, but then SOS takes over and then then actually deducts it from whatever warehouse location basically.
Them: Yes.
Me: Got it, okay. Interesting. Cool. Okay, that makes sense. I I I think, like, I have some other couple questions. I just wanna run by these thoughts. I think I understand how this workflow works, but for the sales management team, we have, like, couple of different prototype ideas. And I wanna understand, like, your your opinions on these. Right? So
Them: Okay.
Me: our first one would be an ERP prototype. So imagine method as an ERP in the future We have our own inbuilt out of the box inventory management solution that has all of these, you know, advanced core functionalities, you know. Managing warehouses, managing live inventory tracking, managing multiple location based inventory and so on and so forth. Right? The target user would be, you know, these power users, these big enterprises, these big like manufacturing warehouse distributors. Right? That's and these types of things would come out of the box, no customization. That's the first one. The second prototype we're thinking about is like an integration prototype. So here we make it easy very easy for our app builders, for our professional services teams to make these integrations as seamless as possible with these inventory management solutions. Like SOS inventory. And this would target, you know, build businesses who already have established inventory workflows with another company but want to integrate with Method. To make a seamless integration and streamline their entire operations. And then we have a hybrid approach, which is our third prototype, which is like combination between the first two, but the hybrid one would mean we have a couple out of box, inventory functionalities for customers who you know, don't really wanna use all the advanced functionalities of let's say SOS inventory but only need a couple things to get their workflow done on method, But still, we wanna provide that integration flexibility with other bigger players in the industry. What do you think about these? Like, what's catches your eye? What do you

think? Would solve the pain points of our customers from the people that you've you know, serviced, you've, you know, helped customize, you know, solve their problems. Well, which one, like, really speaks to you? Yeah.
Them: Majority of the time, it'll be the very first prototype that you mentioned. An in house system just because majority of the customers that I've spoken to at least don't have inventory system and usually ask, like, can method make me an inventory system? In fact, I've heard not just from myself, but my fellow colleagues that they have attempted or we've all attempted to build some sort of internal inventory system where it will deduct and add inventory for us. So I'm strongly
Me: Okay.
Them: strongly leaning towards the first. Right?
Me: Mhmm.
Them: The second one will be the hybrid approach.
Me: Mhmm.
Them: Where, you know, you get a little bit of both worlds. Right? You get the basic functionality and some people do like integrating with the bigger inventory systems just because I I'm not sure what tools you'll have available for us if you go through the hybrid approach. It might be that know, don't need the integration at all. What your hybrid approach has might be just enough for those customers.
Me: Mhmm.
Them: And the last one is the integration one. That's already what we're doing.
Me: Mhmm.
Them: Right? I I people are okay with it. I wouldn't say they're completely happy.
Me: Mhmm.
Them: So I would rank that as my last, but definitely major one is the in house one.
Me: Got it. And you mentioned how, like, people on the team have tried to make these in house
Them: Yes.
Me: features. Right? Total, like, out of the box, like, you know, these customized features for inventory you have any examples of customers who have that? Functionality right now that you could share with me?
Them: I I don't, unfortunately. Sorry.
Me: Okay. Okay.
Them: I I can ask the team. Right? See and then
Me: Yeah.
Them: and ask them to give me a list, and then I can I can report back to you?
Me: That that would be awesome if you could just for us to, you know, explore these different options, even maybe
Them: Mhmm.
Me: to these customers how they're liking. These types of solutions.
Them: Mhmm.
Me: Because, yeah, right now, we're just trying to, you know, weigh the pros and cons of these protests, what makes the most sense as a company, as strategically as well as for our customers. I also had, like, one more I guess, this prototype that two people have mentioned about is, like, you know how we have QuickBooks desktop. Right?

Them: Mhmm.
Me: QuickBooks desktop has way more advanced inventory functionality compared to QuickBooks online. And when customers, you know, transition from desktop to online, they lack that advanced functionality capabilities. Right? And they wish they had those things. Do you, envision a future where, Method could potentially, you know, have those advanced functionalities that a desktop had that QuickBooks Online currently doesn't have, and that could suffice our current customers and future ones. Okay.
Them: It would take a lot of work. I'm not going to lie.
Me: Okay.
Them: Like, I think I think I think we are capable of going somewhere, especially with, you know, the product team.
Me: Mhmm.
Them: But, like, it's going to take a lot of work. Some of the features that I hear mentioned is, like, I wanna be able to scan in my, you know, my packages, scan in, I want barcodes. Right? Stuff like that. I don't know if method is capable of handling those things.
Me: Mhmm.
Them: Right? Or, for example, when I bill a customer and adds in that's fine. I like bill customer who adds inventory to my system. Know, when I when I the invoice gets paid, right, or when I make an invoice, I guess,
Me: Mhmm.
Them: moved from the system. Right? Stuff like that. Right? I'm I want to say I would love Method to very for to be able to handle it, but I'm not sure.
Me: Got it.
Them: Right?
Me: Okay.
Them: Yeah.
Me: Cool. I think that's, honestly awesome. Thank you so much, Eric, for all this
Them: No worries. I'm
Me: valuable insight. I really appreciate it.
Them: No worries, John.
Me: I'll definitely review all this data you gave us and report back to the team, but
Them: Sounds good.
Me: yeah, I'll, I'll reach out to you if I ever need any more questions, insights. And if you do have a time to
Them: Yeah. Oh, yeah.
Me: provide any of those companies that you've worked with let let me know and share that information with me.
Them: Will do. Will do.
Me: Perfect. Thanks so much, Eric. Have a good one.
Them: No worries. You too. Bye.
Me: Alright. Bye.
