Safwan / John (1:1) - Inventory Solutions

Current Inventory Solutions

- Customer (Endura/Lancaster) implemented custom inventory tracking through inFlow integration
- inFlow allows breaking down items across multiple locations (vehicles, warehouses)
- Real-time quantity updates triggered by:
    - Work order pausing
    - Service completion
    - Final invoice creation
- Integration between inFlow and Method, not QuickBooks Online

Key Pain Points & Challenges

- Cannot reduce inventory quantities without creating invoices
- No native support for multiple warehouse locations in Method/QuickBooks Online
- Manual warehouse updates required to maintain accuracy
- Negative quantity handling issues
- Limited reporting capabilities:
    - No built-in sales tracking by SKU
    - Lack of seasonal trend analysis
    - No automated run rate calculations

Custom Solutions Implemented

- Warehouse Management System:
    - Custom grid showing inventory by location
    - Manual warehouse update process to prevent errors
    - Line-item level warehouse selection
    - Ability to select multiple warehouses simultaneously
- Inventory Analytics:
    - Run rate tracking based on 2-month and 6-month averages
    - Replenishment time monitoring
    - Sales forecasting capabilities
    - Automated notifications for low stock

Future Solution Recommendations

PS team member recommends hybrid approach with preference for native Method solution:

- Basic Capability: Mirror QuickBooks Desktop functionality
- Better Option: Build native Method ERP system

- Best Option: Comprehensive solution with both native features and integration capabilities

Key consideration: Native Method solutions preferred over API integrations due to:

- Faster issue resolution
- Better control over customizations
- Reduced dependency on third-party response times

Trancript

Me: Hey, man. How's it going?
Them: Hey. What's up, bro?
Me: Doing good.
Them: I'm good, man.
Me: Good. Good. Yeah. You know, thank thanks for, joining me today. Like, I really appreciate it at, late notice.
Them: Yeah. Yeah. No worries. No worries.
Me: Yeah. Yeah. So
Them: Just, had to wrap up a few calls, but, yeah,
Me: okay. Yeah. Sorry. I'm not, like, like, bugging you at a right wrong time. Right? It's a good
Them: No. No. No.
Me: oh,
Them: Yeah. Yeah.
Me: okay. Awesome. This would just be, like, a really quick call. So, like, I'm John. By the way, I don't think we've formally met yet, but, yeah, I'm a PM for the sales management team. Our team's working on one of our big bets is to, ship a inventory match management lovable product. And, we're in the prototyping stage right now, and we have a couple of options, but before we can, like, you know, try to, like, prioritize one, we wanna, like, talk to the PS team to you know, understand, like, what types of customizations or workflows that they've implemented for our customers. So I was speaking to Asher and he mentioned that you, did a integration, a custom inventory solution for Endura materials. Right? So
Them: Yeah. I I believe so. It may have been a while back.
Me: Yes. Okay.
Them: I can't remember, but I'll take a look.
Me: Okay. Sure. Yeah. Yeah. Like, I need anything helpful here, man.
Them: And check.
Me: But, I think, like, the first question is, like,
Them: Yeah.
Me: just wanna understand, like, their background. Like, do you remember, like, who they are and what they were doing? Like, what they did as a business?
Them: Not on top of my head. Are these still in method? I don't I can't search for them.
Me: No. So there, I actually I do think I'm not sure. Let me give me a sec.
Them: Maybe if I can go back to my time entries, I could
Me: Okay.
Them: see what I did for them.

Me: Yeah. They're no longer a dedicated client, but
Them: Yeah. I can't even search for them. Some like, as, like, a account. That you could sign into.
Me: Yes. I tried looking on Alice as well. I didn't see them as well. So maybe they canceled.
Them: Yeah. Usually, when they cancel, you're not able to see them anymore. I could probably see my time entries, though.
Me: Okay. Sure.
Them: Endure. And their materials. Okay. So
Me: Yeah. They canceled on Tuesday, 08/13/2024. Yeah. I just found I found
Them: Oh, this is, this is Darlene Willeford. Yeah. Okay. Yeah. So this
Me: Okay.
Them: they were called Lancaster before.
Me: Mhmm.
Them: In their materials. It's just a different name, I guess. Let's see if Lancaster is still available.
Me: Okay. Okay.
Them: Lancaster Associates.
Me: Is it there?
Them: The thing is, if it's this customer, I haven't really developed inventory tracking for them specifically. I've done other things, though. I don't think I've done, like, inventory tracking ex extensively for these guys. To my recollection.
Me: Okay. Because, I think Asher mentioned that there was, like, a SOS integration, or do you not remember doing that? Yeah.
Them: SOS inventory for these cars? I don't remember. SOS inventory for these
Me: Okay. Let me just
Them: No.
Me: take a quick it's it's Lancaster and Associates Inc, right, on, like, method? Like, if we could to go to that version? Alright.
Them: Yeah. Lancaster Associates. Like, well, like, Darlene Woloford, like, the point of contact. They were my dedicated, and their account was Lancaster. I think it changed to Endure Materials afterwards.
Me: I
Them: After they got acquired by another person called Frank. So he acquired the company, and then I think Method just changed the company.
Me: Got it. Make
Them: Name here, Tender Materials, because that's his other company that he used before.
Me: Got it. Makes sense. Okay. So, like, I think right now though, they're not using method. Right?
Them: Yeah. I think they stopped using method.
Me: Okay.
Them: Lancaster is still an active account.
Me: Mhmm.
Them: Maybe with just one user for data Yeah. Just one like, the primary users assigned to it just for data

Me: Mhmm.
Them: keeping purposes.
Me: This Lancaster account prob does it have any, like, inventory, customizations or anything like that or no?
Them: I can
Me: Yeah.
Them: I can check. But in the time that they worked with me, we didn't really
Me: Okay.
Them: need any inventory tracking, customizations.
Me: Got it. Maybe then, maybe we can take a little bit. Do you, are you have you done any inventory customizations to, like, like, our
Them: Yeah.
Me: that are definitely, like, valuable customizations or, like, you know, sustenance? To student customers or
Them: Yeah. I've done different things. Like,
Me: you Yeah.
Them: I've done things that have just lived within method, and then other things that are, communicating with, like, other softwares, like, let's say, like, inFlow. So
Me: Yeah.
Them: So I can I guess I can talk about Inflow first, and then I can because the ones that are done in method are a bit more detailed?
Me: Sure. Yeah.
Them: So what I did in inflow was it's they have a separate software for inventory tracking. The way it does it is it breaks down like, let's say, item a amongst, like, multiple locations, which is something that method or QuickBooks can't do right now even with advanced inventory.
Me: Yeah.
Them: You can't break them down into, like, let's say, different vehicles or different warehouses. So what we did with that was, this customer, they have field services and work orders. And they wanted it so that let's say, technician a, like, let's say myself, I go into, like, an actual customer's location, and I have, like, five of, like, a certain cylinder in my,
Me: Mhmm.
Them: in my truck. I'm gonna use one of them. So soon as I put it on a work order, I need it to be able to be reduced from my quantity.
Me: Mhmm.
Them: In inflow So that's one thing I developed for them is, like, even though it's not invoice because right now you need an item to be invoiced in order for the quantity to be reduced. In QuickBooks. So what we did was, even though it's not invoiced,
Me: Mhmm.
Them: it's still being used in an active location. The work is not done. So we need it so that even if you're, like, saying, okay. We're pausing service, but I've used this item. That should subtract that quantity
Me: Yeah.
Them: from the from that vehicle or that
Me: Got it.

Them: service technician. So that's one part of the customization. And then constantly updating that. So let's say this is a three day project. So I've done it on the first day. I've used one cylinder the first day. It should also already reduce from my quantity. On the second day, if I use another cylinder, that should again reduce it for my quantity.
Me: Mhmm.
Them: And, of course, the final invoice should just do, like, a final check and reduce quantity as necessary.
Me: So is this, like, real time, like, updates, or is this like,
Them: So
Me: a like a manual override? Like, how how did that, like, decrease in did it reflect in both inflow and method? Like,
Them: Yeah.
Me: sign like, right away? So
Them: Yeah. So I don't think it's doing anything in method. They're not using the quantity on hand in method. At this point. They're just relying on inflow to do that. And the in
Me: Got it.
Them: update in inflow is real time. Like, it's based on, like, you clicking a button. So you're saying,
Me: Yeah. Yeah.
Them: pausing service for the day or, like, creating invoice. That's what will rerun the API, and then either update the quantity or
Me: Got it.
Them: just, like, subtract from it. Based on
Me: And you
Them: what you have.
Me: and the it's gonna update with method, though. Right? It's not updating with, like, QuickBooks online, and that syncs with method's inventory. Right? This is between inFlow and method.
Them: Yeah. This is between inflow and method.
Me: Alright.
Them: And then,
Me: Yeah.
Them: yeah, we're not we create the invoice,
Me: Yeah.
Them: and then once we create the invoice, that will reduce the overall item quantity
Me: Got
Them: in method and inflow. But up until we create that invoice, method doesn't really have anything to do that. That's why we're using inFlow.
Me: Interesting. Okay. There's a lot of, like, companies use Inflow, like, from your experience, or is this just like a
Them: This was the one and only customer I've worked with.
Me: one and a half million customer? Okay. Yeah. Yeah.
Them: But, yeah, this was kind of yeah. This was kind of extensive for them, like, just
Me: Yeah.

Them: doing this. I haven't really heard of any other customer doing inflow.
Me: Yeah.
Them: A lot of people do SOS inventory, but I think SOS inventory does
Me: Mhmm.
Them: direct integration with QuickBooks. So we never really have to customize SOS inventory
Me: Got it.
Them: stuff.
Me: And what what would you describe as, like, the main challenge or pain point that this one customer had with Method
Them: The biggest one was, like,
Me: Got it.
Them: without invoices, they still need to reduce quantity because
Me: Yeah.
Them: like, it could be multiple day projects, and you're gonna be invoicing people, but you also need to have an accurate count of your inventory.
Me: Makes sense.
Them: So, being able to do that prior to invoicing
Me: Mhmm.
Them: which is not something QuickBooks or method can do, that would be a really helpful tool, especially especially, like, for multiple day jobs and stuff.
Me: Okay.
Them: If you're using inventory items. That's it. That would be one.
Me: Mhmm. Mhmm.
Them: Maybe going to reduce a negative quantity. I don't know if negative quantity is supported, but sometimes I don't know how how you do that, but that has come come up for me. Like,
Me: Okay.
Them: can we just reduce it to a negative so that we can, like because another truck may have it, so maybe we can just
Me: Yeah.
Them: transfer it. Things like that.
Me: Makes sense. Okay.
Them: So that and then other than that, I've done, like, method solutions for inventory tracking.
Me: So maybe I can learn more about that, like, maybe go into detail about like these steps solutions for inventory that you've created on Method. That's mine, man. Take your time. Like, no stress. Mhmm. That'd be awesome. So, like, managing multiple warehouses is, like, a pain point and that's not something that comes out of out of stock for Method or QuickBooks online. Right? Got it. Yes. Mhmm. Moment. Got it. Got it. Okay. So was that resolved, or is it still, like, not solvable? Mhmm. Okay. Okay. Mhmm. Mhmm. So you click update warehouse a day once a day, basically. Like, Yeah. Okay. Mhmm. So you have to be, like, oh, you so you can do multi select and you can choose all like, updating all the warehouse
Them: Yes. Yeah. So, what's an account that I did this for? Let me see. Can't remember the names on the top of my head just because I Vedera. So that's another company that I worked with So with this customer, this is another one. They didn't do any sort of softwares to, help them with inventory tracking. We just sort of tried to do everything within method. This is when I

realized that it's very tricky to do inventory tracking in method because there's screens that you don't think about or a lot of things that may have go may go undiscussed, and then it comes up as, like, an issue. It's for these guys was their issue was that, yeah, like, QuickBooks or method doesn't support the the different locations. Like, you can't put something in different like, let's say, a Toronto warehouse or, like, a Milton warehouse, you can't really do that well. So I'm not sure if they reverted it. I'm gonna share my screen, actually, if that helps. Exactly. Yeah. Can you see my screen? Yeah. So this is for a part item. This is, like so QuickBooks returns the the standard quantity on hand. Doesn't do anything with, like, breaking it down. So that's what we did. Like, we're just breaking it down within our warehouses. So you can add a many warehouses as you want, sovereign, inferior. You can add any warehouse here. So you could just give them the option, and then add the quantity. Already, you can see that it's not a match. So quantity here is 91, which is what's going in QuickBooks. And then our quantity here is 93. Something was missed or they probably just corrected it, like, or didn't change it properly. I'm not sure what's going on. This was done, like, maybe a year and a half ago. So I'm not sure what's been done with it since. But, yeah, like, it leaves a lot of, like, errors like, open spots for manual errors. Like, verifying whether this quantity actually adds up to what the actual quantity is. So things like that. We're not gonna change this because invoices will update this when necessary, but we have to worry about updating this every time. And the biggest challenge is adding and deleting transactions. So let's say you made an invoice, which would subtract two from Ferrier, but that invoice got deleted or that quantity got changed, how do you cater to that change? How do you come back and update this grid over here to say, oh, I've added three to it. I've added four to it. I've subtracted three or four from it. That was one of the biggest hurdles, and then yeah, just keeping up with that. Was one of the big things. So So we what we did was we had to implement some, like, physical checks, like, okay. We're we're going to only update the warehouse when we're ready for it. So up until those changes, like, oh, like, we're adding two. We're gonna take off two again. Tomorrow or delete the invoice entirely. Things like that were not going to update warehouse until you say update warehouse. So I have a button that says update warehouse now. That's what would do it. And then once you've done it once, method won't let you do it again. So that's kind of how you stop like, double tracking one invoice. So that was one way. It's not the best because people could forget updating warehouse from time to time. So I Yeah. Once a day or once per invoice. So you could do it individually on invoice levels. That would be best. Or you can do, like, a multi select.
Me: simultaneously.
Them: That'll be possible. Yeah. You could do that via
Me: Okay.
Them: customization.
Me: Okay. And, like, let's say this user is creating, like, a sales order. Like, when they're, selecting items, can they
Them: Yeah. They can. Yeah.
Me: choose by warehouse or no?
Them: So let's take a look. At it. So yeah. Quantity So you select the warehouse from the top. I think, one thing we did was so you can either do it on the line level where you're saying, okay. This is coming from Farrier Warehouse. This one's coming from Sovereign Warehouse.
Me: Mhmm.

Them: So you can either do that you could just do it on an overall invoice level. Totally depends on your workflow.
Me: You
Them: I don't know if you're gonna have two items from two different warehouses within one That's something the customer has to check.
Me: Yeah. Yeah.
Them: But it would be possible either way. So what we did for this customer was just select her her invoice. And then based on that, we can then track to see, what's the quantity that they're trying to enter and what's available in the warehouse. So that's one level of check that we can implement here saying, oh, you don't have sufficient quantities. Things like that. You can automatically verify here if you select the warehouse beforehand.
Me: So, like, quantity in warehouse Right? Why is that blank right now? For, like, the first line item?
Them: Maybe it's already blank for them on the line level.
Me: Okay.
Them: Maybe it's already blank for that item. I could check. So they have negative quantities. So this one was,
Me: Mary
Them: Ferrier. It's a negative quantity, which is probably why it's not loading here. I'm not sure why it's blank, but it should have been, like, negative 19 here.
Me: Okay. Okay. So, like, if the you do have, like, a negative
Them: Ideally.
Me: quantity, do you or are you still able to, complete the sales order or no? Like, would okay.
Them: Well, this is a custom field. So this won't really stop anything from happening. I can customize it to do that,
Me: Yeah. Yeah. Mhmm. Mhmm.
Them: but QuickBooks won't have any issues with it.
Me: I see. Okay.
Them: QuickBooks will only have an issue if you have more than this quantity because that's the one that's going to QuickBooks.
Me: Got it. Got it. So, like, basically, anytime, like, basically, the workflow here is, use this user has a pain point of, you know, there's no, they can't sort by warehouse, sort by inventory, and you customized it by having, like, locate like, inventory by warehouse. And in each different transaction, they can choose the warehouse then choose a line item associated to, like, a specific warehouse. Once that's saved, it's a manual process then to, like, make sure that the warehouse is updated with the reflection in the live inventory
Them: Yeah.
Me: Correct? Got it. Got it. Okay. Okay. So
Them: Yeah. Exactly.
Me: so in this sense, it's not technically live either. Right? Like, it's not like live inventory here. Like, whatever, like, whatever transaction
Them: Yes.
Me: you're doing, it's not really, like, updating QuickBooks online or, like, method in general inventory levels. Right?

Them: Yeah. Like, it's based on manual entries and clicks
Me: Yeah. Yeah. Yeah.
Them: We can, of course, run checks John the background. So that's one of the thing with,
Me: Yeah.
Them: doing inventory tracking and method is it's very extensive. You're gonna have to fully discuss with your clients. So that's, I guess, one of the pain points is, like, there's so much to discuss, like, what update what should a bid quantity, what's the expected behavior, like, what do we do about something that's negative 19?
Me: Mhmm. Mhmm.
Them: When I can actually see that there's 34. So how did this happen? How do we
Me: Mhmm.
Them: avoid this from happening? How do we make this more reliable? So those are just the question
Me: Okay.
Them: questions that you have to sort of answer.
Me: Makes sense. Do you mind, like, why do why do we have, like, two different columns two different quantity columns? It's just curious. Like, for the warehouse locations.
Them: I'm not sure. I
Me: Yeah. Okay. I'm just yeah.
Them: would have probably developed one of them. I'm not sure why there's a second one there. Yeah. Like, with this was probably, like, a pay this was a pay per use case for me. So
Me: Yeah. Yeah.
Them: what they do is they sign up for, like, different cases with different people after. Maybe the second column got added at
Me: Okay.
Them: some point. I'm not sure what it would be for.
Me: Cool. No no worries, man. That's all I did. Another question I have is, like, what would, like, based on, like, all the customizations that you've done, like, solving these customers' problems, what would, like, an ideal inventory management solution look like for Method? Like, from your experience?
Them: Ideally, it would it's available, but it's not really available. So, ideally, what I would just want is another grid like this that's not custom built, that's just stock,
Me: Yeah. Mhmm.
Them: and it's just available for method.
Me: Mhmm.
Them: It would have the locations as it is, like Sabrin and Ferrier.
Me: Mhmm.
Them: As it lays out over here. And then ideally, just to make it a, like, a bit more specific, I would have the warehouse location
Me: Mhmm.
Them: on the line level so that it's based on individual lines.
Me: Mhmm. Mhmm.
Them: Of those items. And then
Me: Mhmm.

Them: it would automatically just communicate with QuickBooks and then update the quantity on the warehouse independently.
Me: Mason. Mhmm.
Them: Without me having to do it through logic. That would be the best thing. So, like, covering up for what's not there using code is the diff most difficult part.
Me: Mhmm. Mhmm. Mhmm.
Them: Because you and I can both see that this would work if it just followed
Me: Yeah.
Them: if it just followed what it needed to do. It wouldn't be too hard. So, yeah, I would just say, like, doing what it's doing right now, like,
Me: Yeah.
Them: appearing exactly how it is, and just executing on the function without having to, like, account for it so that it would never have to go to a 19 so any invoice that was linked to Ferrier if it's still there, it should be there. It's deleted, then just automatically remove it from here.
Me: Mhmm.
Them: Things like that. So I think this if it actually existed, would be what I would be looking for.
Me: Awesome.
Them: And what a lot of customers look for. Which is just, yeah, like, having warehouses within each line and then having that update on the item itself. So that they can work on it.
Me: Mhmm.
Them: Yeah. So you can have, like so the inflow thing that I've done, which
Me: Yeah.
Them: is, like, the software that I was talking about, they just have individual item profiles, and then they have a list of all the locations with that quantity. So
Me: Mhmm.
Them: that's basically doing what we're trying to do here.
Me: So
Them: So I guess that's all people would be looking for. It's just to break it down by warehouse,
Me: got it.
Them: one thing to consider is you could either do it based on warehouse or users. Because if if the users are, like, actually the ones driving and they have their own
Me: Mhmm.
Them: I guess, inventory, then maybe you can have a way to select if it's based John user or where
Me: Makes sense. So, like,
Them: or vehicle. Let's say.
Me: what I'm getting I'm getting at is, like, one of the core features that a lot of your customers, like, want is, like, managing by multiple warehouses. Right? And, like,
Them: Yeah.
Me: like, that real time visibility into their stock level at any time of the transaction flow. Right?
Them: Yeah. That would be the biggest, I would say.
Me: Got it. Got it. And, like, is there any other feature requirements that they're looking for? Like, is, like, like, like barcode scanning, like tracking by lock, SKU, stuff like that. Is that something that you've noticed customers want or, like, even other features?

Them: I have
Me: In general?
Them: I haven't personally worked on anything barcode related. I think a few other reps from our
Me: Okay.
Them: team have. I'm not sure if you know who they are. I've definitely heard of that con
Me: Okay.
Them: conversation come up before barcodes. I haven't worked on barcodes
Me: Mhmm.
Them: in particular. Maybe it's on the transaction level. Yeah. I'm not sure who may have worked on this. Maybe, like, Yasar or Matt, maybe.
Me: Okay.
Them: So you could maybe reach out to them. They might have a better idea. But other than that, in terms of SKU, yeah, I heard SKU come up because
Me: Yeah.
Them: you could have, like, one overall SKU, and that can be broken down into three or four items.
Me: Mhmm.
Them: And you wanna track sales, something that it's come up is, I don't wanna track the sales for those skews individually. I wanna track
Me: Mhmm.
Them: overall sales for them together within a certain time range. I think what Method is lacking is just, like, reports on items. And, like, how much, each item is selling, what's their most popular item, what's the least popular item,
Me: Yeah. Yeah.
Them: things like that, you don't really have available. So I think that's come up for me.
Me: Yeah. Yeah.
Them: Is tracking based on, like, the most popular SKU, tracking based on, like, seasons, when yeah. We've been done, like, under other cool thing that potentially could be beneficial is I've done, like, run rates
Me: Mhmm.
Them: for another customer. That I can show you.
Me: What's the run rate? Sorry.
Them: So run rate is like, how long you expect a certain
Me: Okay.
Them: item to last you based on past sales. I believe that's what it is.
Me: Okay. Mhmm.
Them: So it's essentially, like, seeing the run rate, on items, like, how long they last you
Me: Mhmm.
Them: based on historic sales, So right over here. So I track, like, the twelve month average sales. So, yeah, it's based on, like, six months, two months, and then what's the run rate in that two month? So, like, how much are you using? I believe totally forgot what run rate is, but and then average replenishment time. So are we giving the item enough time? So this is just like inventory management.
Me: Mhmm.

Them: To a certain extent where what's available what's our forecasted sales,
Me: Yeah.
Them: and do we need to replenish those items right now, or do we still have time?
Me: Right.
Them: If we don't have time so if the average replenishment time is usually two months,
Me: Mhmm.
Them: and, we're gonna run out of it in one month, we need to notify the like, manager that, hey. This item needs to get replenished. So basically, yeah, like, tracking sales and then reporting on it so that people can replenish when necessary.
Me: That that's a really unique feature. Damn. Didn't even know that's something people look for, so or want.
Them: Yeah. This was just one customer that looked
Me: Yeah.
Them: for it. And, yeah, he gave me the formulas and everything that he needed because he's, like, a
Me: Okay.
Them: a supply chain manager and stuff. So, yeah, he just gave me everything, and I just used that.
Me: Not nice.
Them: Your Yeah. So it's basically based on, like, revenue trends and, like, how much they think they'll need up and yeah, if they don't if they predict that they don't have enough to, like, cater to, like, let's say, their six month average sales or six or, like, two month average sales, then we can notify them.
Me: Yeah.
Them: Saying, hey. Doesn't seem like you're gonna be able to meet up your, yearly sales goals or something like that.
Me: Got
Them: So
Me: Cool. That's awesome.
Them: yeah, Yeah.
Me: One last thing before, like, end the call, but, like, we have a couple of prototype options. The first option is, like, we make method into its own ERP solution, so, like, its own out of the box inventory management solution. The second option is we do an integration approach. So we method integrates with an advanced, inventory solution such as Katana, SOS, Fishbowl, something like that. The third option is like a hybrid between the first two. So we provide, like, out of the box, like, functionalities and method for, like, you know, the smaller companies who don't need, like, the advanced inventory capabilities that, like, SOS or katana have, we we still provide that integration functionality for the bigger bigger fish so that they can, you know, use all those features in more advanced, software. And then the fourth option that we're currently exploring is a lot of users and a lot of PS teams have mentioned that, like, QuickBooks Desktop has, like, all the advanced functionality you need with inventory, but a lot of people move cookbooks online. And they find that they it's lacking almost every sense, and that's why they're looking for these customizations. To almost like match that functionality with desktop version. So what if we you know, make method into that, like, desktop functionality of desktop inventory

management. So out of those, like, four different options that I presented, like, which one, like, kinda speaks to you? Which one, like, based on your, interactions with customers might solve their problem the best. Yeah.
Them: So what were the four options again? Just to recap. One is, like, an integration with, like,
Me: Yeah.
Them: Katana, which would be for bigger companies.
Me: Yeah. We have it here
Them: And then what was the what was the other ones?
Me: We have an ERP solution, so Method is its own inventory management. So out of the box, it has capabilities already.
Them: Mhmm.
Me: More than what we currently have, like managing multiple warehouses, live inventory tracking, so on.
Them: Mhmm.
Me: The next one is a hybrid of the first two. So we provide out of the box capabilities, but also an integration.
Them: Mhmm.
Me: The third one is, like, we mirror, like, QuickBooks desktops advanced inventory functionalities into method. Because that's what QuickBooks online doesn't currently have. So what are you thinking? Like, what do you what do you see? Like, based on what you know from customers,
Them: Yeah. I like a hybrid solution where, like, we if we're like an ERP system, I feel like that would that would definitely be beneficial just depending on, like, when we could access something like that
Me: Mhmm.
Them: And then yeah. I think if method has like, it's just, like, for me, it seems like good, better, best. So, yeah, I think one of like, having basic capabilities or just replicating what QuickBooks Desktop did I think QuickBooks Desktop just had, like, the, where you can track it independently within each transaction line. And then
Me: Mhmm.
Them: that would update the warehouse. So I would say that's good.
Me: Mhmm.
Them: Better is, of course, the ERP system. And then best is, I would say, like, just comprehensive, like, because they could cater to that, but then what if they want more? What if they have even more
Me: Mhmm.
Them: custom solutions? So at that point, either we can customize our EOP software or just
Me: Mhmm.
Them: use an external API one thing I've noticed is whenever we have to rely on API, any issues have a very slow turnaround time because it's not our software. It's, like, theirs.
Me: Mhmm.
Them: Like, so why I usually refrain away from it. Because if it's within method, it's still much more within our control. Like, either it's something I can fix via customization or I can make a ticket that can be solved.

Me: Yeah.
Them: So that would be my only feedback. So I would love it if Method could just do the whole thing by itself.
Me: Mhmm. Makes sense.
Them: But if it can't, then have to do what we have to do.
Me: Makes sense. Makes sense. That's a good insight, man. Thanks. Thanks, dude. Like, I really appreciate like, all the insights you shared. If I have any more questions, I'll definitely reach out to you. I have still I have a couple more PS team calls that I plan to do this week just to get more feedback. But, we're just, prototyping, discovering more different prototype options, but, as we explore more, I'll probably loop you in and get more insights into it. So really appreciate it.
Them: Yeah. Thanks, man. Yeah. Let me know if you need any other, like,
Me: Yeah.
Them: you need any more insight or any help or just wanna discuss more. What are you guys leaning towards right now, though?
Me: It's honestly kind of early to say. From what we're, like, leaning towards, like, I integration seems like the best route right now. Like, but it's it's too early to say, I think.
Them: Good.
Me: So Yeah. Why I'm just still still talking to people trying to figure out, like, how the prototype might look. So
Them: Okay. Yeah.
Me: yeah,
Them: Nice. Well, yeah, let me know if anything else comes up, or you wanna have another chat.
Me: Yeah. Appreciate Let's do it. Yeah. For sure. I'll let you know, man. Thank thanks a lot. Really appreciate it. Talk to you later.
Them: Yeah. Thank you.
Me: Alright.
Them: Simon.
