2-2 Scope definition

Define the scope of the Big Bet or MLP based on customer research and interviews.

With the Hybrid prototype validated and chosen as the best direction moving forward, we are now focused on defining the Minimum Lovable Product (MLP)—a scoped set of features that will deliver immediate value to our customers.

MLP Scope: What We Plan to Deliver

Through extensive discovery of our problem space, user interviews with Partners and the PS Team, and feedback from prototype testing, we've identified the key feature requirements that will define our MLP.

Batch	**Commitments** *The "What" behind the desired customer outcome.*	**Project** (Main Objective)	**Initiatives** *The "How" needed to achieve the outcome,*	**Reach (who benefits)** 1 = high; 3 = med; 5 = low	**Impact (how much of a difference)** 1 = high; 3 = med; 5 = low	**Confidence (validation)** 1 = high; 3 = med; 5 = low	**Effort (Complexity)** 1 = low; 3 = med; 5 = high	**Total score** Lower score = higher priority	**Priority**
BATCH #1	**Multi-Warehouse Management**	JTBD: Allow users to track inventory across multiple locations seamlessly, ensuring that stock levels are accurate and visible regardless of where items are stored.	• Track inventory across multiple locations with clear, location-based visibility. • Ability to create multiple warehouses per item • Ability to update inventory levels per warehouse • Ability to view real-time warehouse inventory across various workflows • Ability to select which warehouse an item should be sourced from across various workflows	1	1	1	3	6	🚨 P1
	Available Inventory Visibility	JTBD: Quickly access real-time inventory levels	• Display available inventory levels across all	1	1	1	3	6	🚨 P1

		at a warehouse level per item across various workflows (estimates, sales orders, invoices, etc.) to make informed decisions and avoid errors.	transactional workflows (creating & modifying) • Be notified when adding more than an item than what's available • Display quantity on hand (on-hand), quantity on sales order (reserved), quantity on purchase order (incoming), available (on-hand minus reserved)						
	Third-Party Integration	JTBD: In need of advanced inventory management workflows or when using existing external inventory management software (e.g., Katana, SOS), users need an integration that works out-of-the-box with their CRM to avoid time-consuming, error-prone manual data entry.	• Out-of-the-box easy integration with popular third-party inventory solutions (no customization required) • Real-time 1-to-1 sync between Method and third-party inventory solutions • Real-time inventory count sync (SOS or Katana > Method) • Sales Order Imports (Method > SOS or Katana) • Manual sync button to trigger syncs • last sync date for inventory quantities in transactions • Sync dashboard to present sync health, status, and history (audit trail) • Ability to disconnect/remove	1	1	1	5	8	P 1

			integrations						
BATCH #2	**Reorder Points & Low Stock Alerts**	JTBD: Prevent stockouts and ensure timely reordering by clearly identifying low-stock items and automating reorder suggestions.	• Ability to set minimum reorder points per item • Ability to set minimum reorder quantity per item • Displays low-stock items in the Inventory Center with an option to create purchase orders	1	1	3	3	8	P2
	Dynamic Item Management in Transactions	JTBD: Users need the ability to dynamically insert, rearrange, and edit line items within all transactions without hassle, ensuring accurate and well-structured documents.	• Support drag-and-drop editing for rearrangement of line items in all transactions • Ability to modify the quantity of items in a transaction • Ability to receive warnings when requested quantities exceed available inventory • Ability to view all item details in a transaction including their SKU, name, description, and pricing details • Ability to add new items to a new/existing transaction	1	1	1	5	8	P2
	[Backorder Awareness]()	JTBD: Ensure that when inventory levels are insufficient to immediately fulfill sales orders, users can easily	• Allows users to override insufficient inventory by placing orders on backorder without interruption to the sales process.	1	1	3	3	8	P2

		place items on backorder to prevent lost sales and manage pending fulfillment efficiently.	• Provides visual cues when an item is being backordered during transaction entry. • Displays backordered items in a dedicated field, enabling users to monitor pending orders and their status. • Ability to manually updated sales orders when inventory is replenished to proceed with invoicing and fulfillment.						
BATCH #3	**Detailed Location Based Tracking**	JTBD: Enable granular visibility into inventory placement, improving efficiency in picking, restocking, and auditing processes.	• Monitor specific storage areas within each warehouse—such as zones, aisles, lots, or bins—to pinpoint item locations precisely. • Ability to input precise locations of an item within a warehouse	3	1	1	3	8	P3
	Item Visualization	JTBD: Empower users to enhance inventory accuracy and product identification by attaching images to items, reducing errors and improving sales and fulfillment processes.	• Enables users to upload and attach one or more images to each inventory item. • Allows for easy updating or removal of images to keep visual data current	3	1	1	3	8	P3

	Item Audit Trail	JTBD: Provide users with a detailed, accessible log of all modifications made to inventory items to enhance transparency, ensure accountability, and simplify troubleshooting.	• Captures a comprehensive log of changes made to inventory records specifically history, transactions, and item details, including adjustments to quantities, locations, pricing, and other key attributes at an item level. • Displays crucial details for each change, such as the date, time, user who performed the action, and the type of action (e.g., creation, modification, deletion).	1	3	3	3	10	P 3

This scope reflects what our users need most urgently—**visibility, control, and the ability to grow**—without overwhelming them with complexity or requiring full-scale customizations.
