Brownsafe & Kearfabrication Workflow/Customization Review

Invited John Miranda Yasar Zaman Elaine Chow Barbara Stevenson

Attachments Brownsafe & Kearfabrication Workflow/Customization Review

Meeting records Transcript File

Summary

John Miranda, Yasar Zaman, Elaine Chow, and John Sandy discussed the workflows, pain points, and Method customizations for two of Yasar Zaman's clients in the Manufacturing, Wholesale, and Distribution (MWD) sector: Brown Safe and Kier Fabrication. Brown Safe uses Method for managing projects, internal communication, and transactional logging (estimates, invoicing, and installation tracking), while their production and material ordering are handled by separate software, Base 44, which Yasar Zaman is attempting to integrate with Method. Kier Fabrication's workflow involves estimates, internal/customer approval, sales orders, and the creation of "jobs" per sales order item, with production managed externally, and both companies utilize custom "job" or "project" apps instead of the standard "opportunities" app. The participants also covered common MWD client needs, including custom pricing levels, advanced inventory management, a desire for simpler custom apps over the complex "opportunities" app, and a high demand for automation, with John Sandy developing a job costing module and Yasar Zaman expressing a wish for developers to enable easy creation of custom project detail apps.

Details

- **Introduction and Brown Safe Overview** John Miranda opened the meeting by stating the goal was to learn in detail about two companies Yasar Zaman works with: Brown Safe and Kier Fabrication, focusing on their industry, workflows, pain points, and how Yasar Zaman's customizations helped. Yasar Zaman suggested starting with Brown Safe and sharing the screen to review the account (00:00:00). Brown Safe manufactures and sells safes, utilizing Method for managing projects related to building and installing safes, internal communication, and correspondence with customers and external installers/vendors (00:01:04).
- **Brown Safe Sales and Installation Workflow** The workflow begins with creating an estimate, which integrates with Avalara for tax calculation, not QuickBooks (00:02:30) (00:08:48). If installation is required, an entire installation project is automatically created, providing a communication hub for vendors and customers while keeping Brown Safe involved (00:02:30) (00:04:29). After the customer signs off on the estimate, an invoice is automatically generated and posted to Avalara (00:03:30).
- **Brown Safe Production and Installation** Brown Safe uses Method's activities to track when to follow up on invoices and installation dates until payment is received after installation (00:03:30). The installation project functions as a hub for communication between the customer and the installer (vendor), who are external contractors (00:04:29). If installation is not needed, they simply handle the shipping on their end, with no detailed shipment records captured in Method other than potentially an activity (00:05:38) (00:12:22). The production cycle of making the safe, including material ordering, happens outside of Method using a different software, Base 44, which Yasar Zaman noted they are attempting to integrate with Method by sending invoice information to start the production schedule (00:06:33) (00:13:17).
- **Installation Project Custom App** Yasar Zaman confirmed that the installation project application is a custom app developed for Brown Safe to manage vendor and customer communication, acting similarly to a work order (00:11:25) (00:15:33). The custom app was created because it is common for the company to outsource installation to one-time subcontractors, making a dedicated Method user for each unnecessary (00:16:27). Brown Safe's use of Method mainly revolves around transaction logging (estimates and invoicing) and project tracking for installations (00:14:25).

- **Kier Fabrication Workflow** Yasar Zaman described Kier Fabrication as having a similar structure to Brown Safe in that they manage production outside of Method. Their workflow starts with an estimate, which requires internal and then customer approval, leading to the automatic creation of a sales order (00:17:24). Following the sales order creation, a "job" (which could be for installation, production, or assembly) is created per item on the sales order, acting as a to-do task (00:18:25).
- **Kier Fabrication Job Management and Invoicing** The jobs app allows them to fill out necessary information from the sales order, add time-stamped notes, and track related tasks (00:18:25). Invoicing occurs only after the job is completed. Yasar Zaman noted that Kier Fabrication uses purchase orders created from scratch in Method, but their integration into the overall process is not fully explored (00:21:20). They do not track inventory within Method, relying on the jobs app to track any project or production progress. They use a daily routine to calculate "weeks in production" and "ship date" fields, which requires manual updating to get an up-to-date number (00:22:29).
- **Common Manufacturing, Wholesale, and Distribution (MWD) Client Workflows** Yasar Zaman estimated they have customized Method for 10 to 30 MWD accounts (00:24:40). A typical workflow for MWD clients is the need for a central location to manage all job-related information, including transactions and custom elements, which Yasar Zaman referred to as "opportunities on steroids" (00:25:39). Yasar Zaman found that these clients commonly use sales orders, often preferring them over estimates when the customer initiates the order (00:27:42).
- **Pricing Levels Customization** Yasar Zaman showcased a customization catalog with common solutions, noting that custom price levels for QuickBooks Online (QBO) or QuickBooks Desktop (QBDT) are a frequent request (00:31:46). They described two solutions for implementing custom price levels: one using routines called onto a specific app to determine the correct price, and another for QuickBooks Desktop Enterprise where price rules are applied on the customer level (00:32:51). For the latter, when an item is added to a transaction, the system checks for a customer's pricing level and applies the corresponding discount or amount rule to the rate (00:33:56).
- **Inventory Management Customization** Advanced inventory management is another common customization for MWD clients, allowing them to manage items and calculate quantities in different locations, similar to QuickBooks functionality

(00:34:53). This basic solution allows users to pull items from specific locations on an invoice or estimate to decrease the quantity on hand, providing information needed to know when to order materials (00:36:06).

- **Common Pain Points and Custom Apps** John Miranda asked about the biggest problems MWD customers face, to which Yasar Zaman responded that many desirable features are not implemented in Method, or existing features like "opportunities" contain unnecessary "bloatware" such as mandatory close dates or stages. This led to many customizations centered around creating simpler, separate apps focused only on the essential data needed for a project, rather than the comprehensive opportunity app (00:38:14) (00:43:54). Both Brown Safe and Kier Fabrication utilize custom "job" or "project" apps instead of the opportunities app (00:39:12).
- **EDI and Shipping** Elaine Chow inquired about Electronic Data Interchange (EDI), which Yasar Zaman confirmed is not directly supported, though two customers have asked about it (00:39:12). Regarding shipping, Yasar Zaman noted that clients typically handle shipping outside of Method, only using Method to generate necessary documents like release labels or packing slips (00:40:08). The challenge of integrating barcode scanning for pick and pack processes was mentioned, which is currently unsupported in a way that aligns with most customers' existing processes (00:40:59).
- **Automation and Future Wishes** The number one feature requested across all industries is automation, particularly for reminders related to estimates or upcoming order dates (00:42:46). Yasar Zaman's ultimate wish for developers is to allow users to easily build custom apps to house project details by selecting required elements like purchase orders, estimates, or specific dates, thereby directly addressing the need for a simplified, universal project app for MWD clients (00:46:18). Yasar Zaman acknowledged that John Sandy, a partner, is working on a job costing module utilizing the jobs app, a feature that will be complemented by the upcoming release of invoice summaries (00:45:00).

Suggested next steps

- [ ] Yasar Zaman will look into older accounts to find more similarities in MWD clients' workflows and share that insight with John Miranda afterwards.

Brownsafe & Kearfabrication Workflow/Customization Review - Transcript

00:00:00

Yasar Zaman: by the way?
John Miranda: It's not that bad.
Yasar Zaman: Okay.
John Miranda: All right, cool. Um, let me just make sure. Are they coming? Okay, they're probably going to join soon, but uh I think we can get started still. Um,
Yasar Zaman: Sure.
John Miranda: yeah. So basically the goal of this meeting is to learn a little bit more in detail about those two companies that you work with.
Yasar Zaman: Sure.
John Miranda: So Brown Safe and Kier Fabrication um learn more about their industry, what they do um their unique workflows end to end uh their needs, their pain points and how your customizations helped uh solve their problems. So um you can start with which whichever company that you want and then we can go from there.
Yasar Zaman: Uh let's go with brown saf first. Do you want me to share the screen and uh go through the account itself
John Miranda: Yeah. Yeah.
Yasar Zaman: or Sure.
John Miranda: Share the screen and then we can go through the accounts.
Yasar Zaman: Give me a second.

00:01:04

Yasar Zaman: I'll swap to the account. Can you see it?
John Miranda: Yeah. Yeah, we can see it.
Yasar Zaman: So, yeah, I'll go through Brown Safe first. Um, basically Brown Safe is a

company that literally just makes safes. So their entire business is making locks or just you know bank saves things like that like security deposit boxes things like that uh across either businesses or just individual people that just want to buy safes. Uh so really in short that's what their business is is just manufacturing those safes and then selling them to those customers as well. Uh so what they use method for mainly is to manage those projects that they have to u you know build the saves for a specific customer and then they manage the todos for either side. So let's say they have someone that needs to make the entire safe or they need to install the safe uh they have communications internally between the installers and um their customers themselves. So Brown safe themselves aren't going directly into the customer's house uh and just inputting in the safe right they have installers that uh or vendors that they you know tell hey go put the safe in their house and so they use method to kind of handle uh some of that uh uh back and forth between u like the communication between the customer and the communication between the installers as well.

00:02:30

Yasar Zaman: So they will first create a quote for the customer. So they'll start start off in the estimates itself. Once they create a quote, I'm just going to use an existing quote. I won't create another one because um they do have like an integration with uh Avalara. So they don't do their taxes from QuickBooks. They do it from Ava Tax themselves. So if I were to create an estimate right now, it would get pushed to Avalara. So we don't want that for now. But basically, they would create an estimate. They would go through the process of selecting the customer uh and then just filling out all the information that they need. If in the estimate they determine that an installation is needed, meaning uh the safe that they build, they have to go install it. Uh they'll answer the question either yes or no. And if they require it, then a an entire uh installation project will be automatically made and then that'll be that'll have its own workflow. But from the sales rep's point of view, they're coming into method, they're creating the estimate.

00:03:30

Yasar Zaman: Uh they're going to be selecting from an existing safe or or they're just going to be creating their own kind of quote itself or uh they're selecting from uh one of the predetermined templates. So when they select from a template, they can add the

items in and they can remove whatever is not applicable. From there, they just email it off to the customer and have them wait for them to basically, you know, give the go-ahhead and sign off on it. When they sign off on it, automatically an invoice will automatically just be generated and post to Avalara. So, from the sales point uh salesperson's point of view, once they get that invoice, the only thing that's left to do is take the uh the actual payment for the invoice, which really happens at the end of the installation process. So they just keep tabs on it via activities to say, "Hey, uh, remember to check up on this invoice. The installation date should be on this date. Just go ahead and kind of use methods activities to find out when you have to go reach out to the customers." So for

00:04:29

Yasar Zaman: the sales rep's point of view, estimate, send it out, and then wait for the invoice to be paid. If they determine that at any point they need an installation, so let's just say they need an installation here. Um, what What will happen is basically an installation project uh can automatically be created. So if an installation project is automatically created, what happens is uh you basically go to that screen to fill it out and then come back to the invoice. But regardless, you can choose an existing um installation project and just tie it together. And all an installation project is is a hub for their vendors and their customers to communicate with each other. So normally they don't have like normally the vendor isn't going to know who the customer or like they're not going to talk to the customer with brown safe not knowing what's going on. So Brown safe wants to keep that kind of discussion within their terms. So what they do is they have the installation project which houses a bunch of portal screens on methods portal where communication between customer and installer can exist.

00:05:38

John Miranda: So, one quick question. So, the vendor, they're the installers, right? They're not the they're not purchasing anything from these vendors.
Yasar Zaman: Correct.
John Miranda: They're the ones that are going to go on the field to these customers and actually install the safe.
Yasar Zaman: Correct. Yeah.

John Miranda: Okay, cool. Sorry in
Yasar Zaman: But um there's a lot of like nuances to the invoice itself, like it could get cancelled. Uh maybe the entire thing gets uh gets um it doesn't ship or something like that. But each one of these options sends an email to the customer letting them know the status.
John Miranda: Makes sense. So, you only need uh an installation project if the customer requires like the the safe to be installed. If else it would just be like uh you're just shipping the safe uh from their site to the customer and then they have it ready.
Yasar Zaman: that that's pretty much it.
John Miranda: Is that like
Yasar Zaman: And so, um, that's kind of like the end component of getting the the safe to the customer, right?

00:06:33

Yasar Zaman: It's either they just ship it off and we're done or we have the communication with the installers. Uh the middle piece to that is that production cycle of making sure uh you know do you have the materials you need to make the safe or ordering materials and things like that. We tried to use method to do that at one point but um the original person that was on that project uh left the company so we never got around to incorporating method. So what they did instead is we do have this production app that kind of handles that um like production cycle from start to finish with respect to an estimate or an invoice or that entire cycle, but because it hasn't been worked on, they use a different um software for it. they use like an AI. Let me pull it up because it is pretty important because they did kind of replace that portion of method with um this one AI builder. I don't know what it's called though. December.
Elaine Chow: Is it from the get load

00:07:42

John Miranda: Is it integrated?
Yasar Zaman: What was that? Base 44. That's what it's called.
Elaine Chow: out?
Yasar Zaman: So they use base 44 bas build their entire website and then let AI kind of handle everything else. So what he's trying to do now is trying to use method or at least

the next phase of this is try and incorporate method to send information to base 44 based on the information on uh like an invoice for example whatever is on a specific invoice and just send it over to base 44 so that the production schedule could start.
Elaine Chow: Just quick question. What are those arrows mean?
Yasar Zaman: uh these ones the these will so it's not
Elaine Chow: Yeah.
Yasar Zaman: recommended because you do run into a lot of issues but uh basically let's say that you have item ABC D right but you know the rep realize it looks better if it's positioned AC cba right so you need to move it up so uh there's no drag and drop feature for the the rows itself so you basically have to use these arrows to push it up or push it

00:08:48

Elaine Chow: Okay.
Yasar Zaman: down.
Elaine Chow: Okay. Um, and then do you mind just walking me through the workflow just one more
Yasar Zaman: Yeah, let's uh we'll go through an estimate.
Elaine Chow: time?
Yasar Zaman: So, it starts with an estimate. Estimate gets created. When an estimate gets created, uh all the tax calculations are handled in Avalara. So the moment you click on save, it pushes something to Avalara, calculates the tax and puts it in as an as a line item.
Elaine Chow: And uh Aara is an external um program that they're
Yasar Zaman: It is. Yeah. So they don't use QuickBooks to calculate their taxes at all.
Elaine Chow: using.
Yasar Zaman: They turn the taxes off on QuickBooks and they just use Avalara to calculate their taxes and do all their tax reportings on Avalara.
Elaine Chow: Okay.
Yasar Zaman: uh once they create the estimate uh they then email it out to the actual C add any CC uh emails that might be necessary or things like that right edit the email and send it off once it gets sent on the customer portal itself so I'll try to replicate it estimate notification we'll just do this So they'll get a little button view estimate.

00:10:13

Yasar Zaman: When they click on it, they'll go to the customer will go to their portal and here they can actually just review the estimate itself and it's just accept and pay the deposit or just accept right away. when they accept at that moment an invoice gets automatically created and then from there it's determined whether you need an installation project whether it's just like we just got to go get the safe made. So there's like a little pause there cuz that's the the the part where they get out of method to handle the production and then they come back in once production is done and they give it off to the installer.
Elaine Chow: H.
Yasar Zaman: So in between that time either the rep or whoever is in charge of the production determines if an installation is needed and then they come into method and then configure that while the production is happening.
Elaine Chow: Okay.
Yasar Zaman: But uh yeah that's pretty much uh like top to bottom with the um the workflow at least. Now you can get into the specifics like the installation project. There's like the brown saves point of view which is this to see exactly what was done all the checklist and everything if people are doing what they're supposed to do.

00:11:25

Yasar Zaman: But there's also the um the installer side of things where uh they have a similar
Elaine Chow: What?
Yasar Zaman: view but uh they're the ones that are making sure that everything is done. So they'll check off or they're they'll enter in specific items or specific information. When they do some of these uh check boxes will automatically be checked.
John Miranda: So this is something you complete once you're on site or after
Elaine Chow: Okay.
Yasar Zaman: Correct.
John Miranda: installation.
Yasar Zaman: So whence like this is basically the installation project itself. So this is where the installers will kind of look to see what needs to be done. It's kind of like a work order, right? They'll look to see what needs to be done and then kind of go out and do the work. But in between they might need to connect with the customer. And so they'll use method to handle the communication and see what's going on, who to

connect with, what they said, if they need to reschedule, things like that. All that happens within the portal itself.

00:12:22

John Miranda: So like if they don't go the installation route and they want to do a shipping route, uh how do they manage that
Yasar Zaman: So they just do shipping.
John Miranda: workflow?
Yasar Zaman: um as soon as like the order is done, they just they handle the shipping on their end, right? There's it's not necessarily noted in method anywhere other than maybe an activity, but u once it's shipped, they wait for payment. So there's no like um record of a shipment being sent out from method that's captured other than an activity.
John Miranda: Makes sense. And the estimate is just the finished goods, right? It's not the like the raw materials or anything like that.
Yasar Zaman: Yeah,
John Miranda: It's for the
Yasar Zaman: estimate is just like uh you're paying for the entire safe, not the components of the safe or anything like that.
John Miranda: Yeah.
Yasar Zaman: This is what the safe costs. This is how much you're going to pay. And then they send it off. And then once they approve that, that's when they determine, okay, we'll need, you know, these materials, these things.

00:13:17

Yasar Zaman: Do we have that? If we don't, we need to order them and so on so forth. So that entire production schedule happens outside of method. And then Yeah.
Elaine Chow: So for so for the so essentially the workflow is uh an estimate and then you would they would go get the estimate approved from there it would just get if it's an installation project it would get uh approved from the portal and then uh if it gets shipped out an invoice is created and this is on site for the installation project. Um, is there any point would would they ever create a sales order or purchase order?
Yasar Zaman: So they would, but that purchase order process wouldn't be in method. Like that's handled elsewhere. So the purchase order and bills process like they do

create them,
Elaine Chow: Okay.
Yasar Zaman: but it's like just the um the accounting person that just creates the purchase orders and bills. Um but it's kind of connected with the production schedule which happens outside of method.
Elaine Chow: Okay. So, they're Oh,

00:14:25

John Miranda: Sorry, Ela.
Elaine Chow: I was going to ask.
John Miranda: Go ahead.
Elaine Chow: Uh, so it seems like they're really just using for transactions logging from an estimate perspective and invoicing.
Yasar Zaman: Yeah.
Elaine Chow: Okay. And a lot of the stuff they're doing is from an external um almost almost like an external extension that they're using. And remind me again some of the ones that they've done. They custom built I guess an app on base 44. Um what is that app for
Yasar Zaman: So that app is to handle the production schedule.
Elaine Chow: again?
Yasar Zaman: So uh the final goal of that app is basically if you're on an invoice for example let's just say you're on this invoice for Paul right so um they'll look at the the safe itself so safe a and uh we'll send over all the uh information and so what it is supposed to do is parse the information to see what the dimensions are what everything is for that safe and then whatever function it uses in base 44 is is just going to determine what's needed, what's already in stock, and what needs to be ordered.

00:15:33

Yasar Zaman: So, all that process is going to be handled within their
Elaine Chow: Okay,
Yasar Zaman: website.
Elaine Chow: John, you had a question.
John Miranda: Yeah. Yeah. So like uh on top of just transactions uh that they handle

within method, they also handle project tracking, right? That's another core element
Yasar Zaman: it it is,
John Miranda: here.
Yasar Zaman: but it's more so with the installation project itself to manage what's being done. So, if a customer ever calls in and says, "Hey, what's going on with my installation? I haven't heard from the guy." Uh, they can come into the installation project itself and see uh, you know, is the customer doing what whatever task they're doing and is this installer doing whatever task they're doing, right? And if any complaints are made, we can just log the complaints as activities.
Elaine Chow: Is the installation project a custom app that you built?
Yasar Zaman: It is. Yeah. So, Brown Safe,
Elaine Chow: Okay.
Yasar Zaman: I think it's been five or six years. So, it's been a while.

00:16:27

Yasar Zaman: Like, I I got handed this account with the installation project made. So, I've been making modifications here and there.
Elaine Chow: And then what's missing? Uh so you said that it's very similar to work orders. Um the question would be like why not you choose work orders if it's very similar and what was missing from work
Yasar Zaman: it it so it's a good question because I do find it with uh field services customers a lot
Elaine Chow: orders?
Yasar Zaman: a lot of times they just outsource to other vendors or other employees so it's like a one-time subcontractor for example that does their work so it doesn't make sense for them to have a dedicated
Elaine Chow: Yes.
Yasar Zaman: user put into method to be able to see it on like a a portal or something like that, right? Um,
Elaine Chow: Okay.
Yasar Zaman: so that's why it's easier to kind of have either a custom app or just an extension of the work order app itself to, you know, handle the communication between the subcontractor and the customer.
Elaine Chow: Yep.

00:17:24

Yasar Zaman: And I think this app specifically was most likely made before the work orders was a thing.
Elaine Chow: M okay. Um, yeah, I think that's it for now. I have more follow-up questions, but I think we're also taking a look at your other
Yasar Zaman: Yeah, cure fabrication.
Elaine Chow: custom.
Yasar Zaman: Cure fab fabrication is kind of in the same boat in that they don't really handle their production project or like production kind of uh management within method. Uh what they do is basically it's kind of the same concept.
Elaine Chow: Okay.
Yasar Zaman: Send an estimate out to the customer. Uh estimate will get approved. It'll first get sent out for uh internal approval and then get sent out for the customer approval. Once it gets approved though at that point um a sales order gets made for that estimate. So you convert it into a sales order. Once you convert it into a sales order at that point whoever is in charge of that order double checks what needs to be done and creates a job.

00:18:25

Yasar Zaman: So like a uh like a work order app except this time it's just specifically one item itself. So they'll say this is a job or this is a job and click save. Once it's saved what happens is on the back end a job will be created for whoever needs to do the work to go out and either fill in information or actually do the work. So if we do all open jobs, you can see that if we click on this for example, uh they fill out all the information that's needed that's coming directly from the sales order itself. And then from here, uh they kind of manage everything and what to do.
Elaine Chow: Mhm.
Yasar Zaman: They add notes that's timestamped and things like that. Uh and then they can see the list of all related jobs for that sales order. So it's like each item itself would be a job to do. If they did the job, they might have other things that they need to do for that order itself.
Elaine Chow: What do you mean by job?

00:19:17

Elaine Chow: As in is it like a installation or is
Yasar Zaman: It it it could so it could be an installation, it could just be like a production itself,
Elaine Chow: it
Yasar Zaman: right? Or it could just be um uh like assembling something, right? whatever the case may be for them because they have different components what they need to do because they make fabrics, they make um uh like equipment as well, right?
Elaine Chow: nice?
Yasar Zaman: It it depends on what the material is. But regardless that like a job is just like a to-do task, I guess you can think of it
Elaine Chow: Mhm.
Yasar Zaman: as.
John Miranda: So they're uh are they a manufacturer of items?
Elaine Chow: Okay.
John Miranda: Like what type of goods do they make?
Yasar Zaman: So they they make I don't know how to describe it. It's like they're advertised as they make all fabric kind of elements, right? So whether it is clothes or whether it is um like like equipment kind of fabric. I don't know if that makes sense, but like that's pretty much all they do is like they they just make fabrics.

00:20:24

John Miranda: So okay,
Yasar Zaman: Like even on their website it's like It wasn't even clear when I when I went on
John Miranda: who are they?
Yasar Zaman: it.
John Miranda: So are they selling to other businesses?
Yasar Zaman: They're selling to So, their main source of income is to other businesses for sure, but they also do mini orders as well. So, if customers order on their site, too. So, when they order on their site,
John Miranda: Okay.
Yasar Zaman: it's not connected to method right now, but that's something that we're looking to do in the future is basically have a customer come in, review the products, and then place an order for those products itself.

John Miranda: Okay, so it looks like they make a bunch of different things other than just fabrics. So process is they create an estimate.
Yasar Zaman: Yeah.
John Miranda: There's a pre-approval internally then approved by the customer and then after that a sales order is automatically created. Uh a job is assigned per item for that sales order and that job could be anything from installation uh to other things connection for that specific

00:21:20

Yasar Zaman: Yeah.
John Miranda: line item.
Yasar Zaman: Yeah, that's pretty much it. And then once that's all done and the project is done, that's when they refer back to the sales order. So, they'll click on the job, close it out, click on the sales order, and then uh either close it out by invoicing everything or uh just partially invoice it if they need to.
John Miranda: And the uh you would only invoice after the job has been completed here for their workflow.
Yasar Zaman: Correct. Yeah.
John Miranda: Okay. And at any point are they also doing anything with purchase orders, purchasing from vendors etc.
Yasar Zaman: they are um it's not it's not something that I've explored with them in terms of how it's incorporated but they do use purchase orders at least create purchase orders from like scratch and method. I don't know exactly how it gets created or like where it is in their process but they do use the purchase orders somewhere in their process.
John Miranda: Gotcha. Um, what how about like uh I don't know if you touched on like production like production is handled elsewhere or within method 2 like uh tracking of inventory and uh etc.

00:22:29

Yasar Zaman: like inventory. I don't think they track at all to be honest. Um if they do, it's somewhere else. It's not a method. But the only thing that they do have to track any any project or any uh production is really the

John Miranda: Oh,
Yasar Zaman: jobs app here. So what whatever they have to do, that's that's about it.
Elaine Chow: Okay.
John Miranda: it says update ship date up there. What does that represent?
Yasar Zaman: So this is for admins. So um in method you so this screen itself has a lot of jobs right it's got a ton of jobs actually uh 280 right so there's two columns in method the weeks in production and I believe it is um the ship date itself the these two columns uh these two columns are calculated uh outside of method so there's like a daily routine that runs that calculates it Right? But maybe you want an up-to-date number itself. And so in order to get the up-to-date number, you actually have to click on one of these two buttons, at which point it's going to update all of whatever all projects, all jobs, which takes a

00:23:42

John Miranda: Gotcha.
Yasar Zaman: while.
John Miranda: And like uh these routines run uh probably like some periodic time throughout the day,
Yasar Zaman: Yeah, it's like once a day in the morning time,
John Miranda: right?
Yasar Zaman: like before anyone comes in.
John Miranda: Okay. And ship date represents uh for that specific job shipping whatever item to the customer.
Yasar Zaman: Yeah. Yeah, pretty
John Miranda: Okay.
Yasar Zaman: much.
John Miranda: Okay. Got it. But they're attracting shipping elsewhere on whatever other
Yasar Zaman: Yeah. They're not using method to kind of like handle any sort of production or anything like that.
John Miranda: platform.
Yasar Zaman: They just have like this is what was done. This is like a record of what we did basically. Not necessarily exactly these are the items we worked on. This is what we did. this the you know this is where we are in in the job itself. This is what we need to do next kind of thing.
Elaine Chow: Oh, how many um MWD accounts have you customized?

00:24:40

Yasar Zaman: Um I don't know like I don't have that number with me. Is it in Allison? Like how do you guys figure out that number? Do you guys just go on like M accounts or like I'll show you what I see.
Elaine Chow: I will. Yeah. On M accounts.
Yasar Zaman: Like I don't like there's no column for me to see what industry they're on without having to go into the actual account itself. So like I have no way of knowing if they're like manufacturing. Um but yeah like yeah like I have no idea. I I would have no idea how they're categorized in method but I like I wouldn't I wouldn't say a whole lot. That makes sense.
Elaine Chow: Mhm.
Yasar Zaman: Like I I probably put it in two digits like maybe like 10 to 30 maybe at
Elaine Chow: Yeah. Then so from these two accounts as well as the ones that you've worked on,
Yasar Zaman: most.
Elaine Chow: what are some of the the typical workflows for those MWD clients?

00:25:39

Elaine Chow: Would you say it's very similar or is it vastly
Yasar Zaman: It's I think it's similar in that at the end of the day they need to they need a place to
Elaine Chow: different?
Yasar Zaman: manage everything. uh so like a central place to just uh this is where we are with the job. This is still all the transactions related to the job. It's kind of like an opportunity but it's it's more open than an opportunity, right? It's like it's not just housing the transactions itself and the interactions that you have, but also here's all the custom stuff. Here's all the like the inventory that's related,
Elaine Chow: Yeah.
Yasar Zaman: all the uh things that we need to do, the todo list, everything like that all in one place. So, it's kind of like it's kind of like opportunities on steroids or something like
Elaine Chow: Okay.
Yasar Zaman: that.

Elaine Chow: Um would you say that they use similar apps for their transactions?
Yasar Zaman: Um, I would say so uh I know there's another one paper I did that it's

00:26:39

Elaine Chow: Mhm.
Yasar Zaman: basically the same concept as these two where in brown safe you have the installation project app and then on cure fabrication you have the job numbers app. It's basically that same concept of just having a un like a one place where you dra you like there's no noise where it's like an opportunity you have a close day you have this you have that right it's more like here's what matters and this is what uh is showing kind of thing there's no generic thing but in like a like a highle kind of point of view it's more like here's a center place for all the information that you need and I think that's like a common point between all uh of those types of
Elaine Chow: And for um some majority of those customers,
Yasar Zaman: customers.
Elaine Chow: are they also handling shipping outside?
Yasar Zaman: Some are I'll actually show you one other that uh this is my actually my first dedicated customer way way back. Parkmark badges. These guys made badges um like they literally made badges and shipped them out.

00:27:42

Yasar Zaman: But um they had an entire system where their shipping process would revolve around their sales orders and then you would select let's say whatever um badges there are on the sales order and then print the release label. So what this does is you know those little stickers that they have that they you plop onto uh packages they would feed that into the printer and then they print out the uh actual little packing label and then they stamp it
Elaine Chow: Mhm.
Yasar Zaman: on. So like they like these customers did incorporate this but I don't know what happened in between when I handed it off like a year and a half ago to now. So um that like I I've seen it here and there but not too often I
Elaine Chow: Okay.
Yasar Zaman: guess.

Elaine Chow: And then do they is it very common for them to use um a sales order for a majority of clients?
Yasar Zaman: I would say so.
Elaine Chow: Yeah.
Yasar Zaman: I would say so because I whenever I get that kind of like distinction of someone make made an order, right?

00:28:42

Yasar Zaman: Like I always push for a sales
Elaine Chow: Okay.
Yasar Zaman: order.
Elaine Chow: And then at what point would I guess for some of your clients, at what point would they want to use an estimate rather than just going straight into a sales order?
Yasar Zaman: Um I mean you could technically substitute it. It's it's more like I would say that a a sales order would be the customer reaching out to you and saying, "Hey, I want to buy this." Whereas an estimate is like, "Hey, here's what I can offer you." kind of thing. You know what? So, I think it it depends on the purpose. If you're reaching out to the customer, either a cold call or just, you know, trying to re-engage with them, uh, an estimate is probably the best way to handle that because you're giving out the quote and you're in charge of it.
Elaine Chow: Mhm.
Yasar Zaman: Whereas with the sales order, it's like it's more so the customer reaching out to you and saying, "Hey, I want 100 boxes of these.
Elaine Chow: And then for purchase orders, are they are they actually using our purchase order app or are they using um as well as external

00:29:43

Yasar Zaman: I so I know a few people do but those people are more so ser field services in a sense where um it's not necessarily
Elaine Chow: Mhm.
Yasar Zaman: like manufacturing anything like that but it's more so um like paying out subcontractors or something like that and you just eventually you create a bill for them

but you start off with a purchase order before they start the work kind of thing. So I've seen it be used but it isn't like a big definer in the workflow in terms of method
Elaine Chow: Okay. Um, at what point would this workflow stop being so linear?
Yasar Zaman: side.
Elaine Chow: Because from what you mentioned to me, it's like it's an estimate. From there, it could be into turn into a sales order, shipping, however they're handling the shipping. Um, and then they would go and invoice and collect payment. At what point does it stop being linear?
Yasar Zaman: a linear as in like it's just like you start from any other place I
Elaine Chow: Yeah. Like is there like miss uh is there like back orders?

00:30:44

Yasar Zaman: guess
Elaine Chow: Is there reorder? Is there custom pricing, pricing levels, multilocation, inventory?
Yasar Zaman: and that that depends on the business to be honest because different businesses handle it differently.
Elaine Chow: Um
Yasar Zaman: So um what I do is I would always start from the the ground which is that linear phase right and then you include those nice to haves which is price levels which is um you know
Elaine Chow: Yeah.
Yasar Zaman: uh price rules or things like that right or back orders or partial orders being completed things like that. Uh you would kind of like funnel them in after you're done the linear part and it only applies to some clients. So,
Elaine Chow: All
Yasar Zaman: it's like it's like as long as you get that foundation,
Elaine Chow: right.
Yasar Zaman: that workflow down, those things can be added later on because at that point, it's just like you keep the same workflow. You're just adding rules via customization.
Elaine Chow: Have you um come up with a solution for pricing levels?
Yasar Zaman: Yeah, we have to uh let me show you.

00:31:46

Yasar Zaman: So, we have a whole catalog. I don't know. Are are you familiar with our catalog or So we have what's called a customization catalog.
Elaine Chow: No.
Yasar Zaman: Now we don't tell clients we have this catalog, right? We just say, "Hey, we've done this customization for customers before. We can definitely customize it." But what this is is basically a list of customizations, common customizations we've done in the past, right?
Elaine Chow: Yeah.
Yasar Zaman: That we basically take and just put it into the other customer's account. So for example um like add subtotal on invoices for example right it's a catalog it's cost half an hour right so we would just plop it into the account charge them half an hour if they if they approve it but uh one of the things here was uh price levels I think custom price levels for QBO or QBDT so Charby made this so basically what it is is uh if you put it into an account, you basically handle price levels uh on like a a transaction level. And so what it is is it creates your price levels and it creates routines that you can call uh

00:32:51

Elaine Chow: Yes.
Yasar Zaman: onto the specific app.
Elaine Chow: Mhm.
Yasar Zaman: So it knows exactly what the actual price should be. Now that's one solution.
Elaine Chow: Mhm.
Yasar Zaman: Another solution was uh like again there's so many different ways you can do this but um tripid rocks I made price rules for them
Elaine Chow: Yeah.
Yasar Zaman: too and these price rules are for enterprise specifically because uh enterp so QuickBooks desktop price rules sync to method enterprise doesn't sync even though it's QuickBooks desktop so for them I had to make price rules uh price levels for them so with these price levels again it's the same kind of concept You put your name,
Elaine Chow: Yeah.
Yasar Zaman: you put the level of what your uh price level is, whether it's the customer level or the item level. Uh additional rules,
Elaine Chow: Mhm.

Yasar Zaman: whatever you want to call it, and then the discount percentage or the amount, and then uh that gets applied on the transactions when they're selecting an item. So, they'll look for the customer, see if they have a price rule, and then apply the price rule if

00:33:56

Elaine Chow: Mhm.
Yasar Zaman: needed.
Elaine Chow: How would that look into the estimate?
Yasar Zaman: Uh what was that? look into the
Elaine Chow: Yeah. Uh so you've created the pricing levels here.
Yasar Zaman: estimate.
Elaine Chow: Um how would you apply the pricing levels into the estimate?
Yasar Zaman: So for this account, it's different than it is on the catalog. On the catalog itself, you basically go into the item. So you go into the estimate, for example, and there'll be a column for your price level.
Elaine Chow: Uhhuh.
Yasar Zaman: So when you select that price level, it will automatically update the rate based on the rules that you've selected. For this account, it's a little different. For this account, you basically go into the actual customer itself. So, for example, this one. And on the customer level, you assign the um the pricing level. So, this is discount 25.
Elaine Chow: Uh,
Yasar Zaman: So, every customer will have their uh pricing level.
Elaine Chow: okay.
Yasar Zaman: And when you're adding the item, it's going to check, do you have a pricing level?

00:34:53

Yasar Zaman: If you do, uh what's the rule? Then it'll go back to the pricing level, figure out the rules, and implement them into the rate.
Elaine Chow: Oh, very cool. Um, something else I was curious about from from everything that you've actually customized, um, do you know what is a common customization that you've done for the NWD clients that you've worked on?

Yasar Zaman: uh price levels for sure. That's one of them.
Elaine Chow: Yeah.
Yasar Zaman: Um there is advanced inventory management. Uh I know I think you guys are rolling out something for that in terms of method side but there is one in the catalog for inventory management. Uh basically all it is is um how you have locations in uh QuickBooks to
Elaine Chow: Mhm.
Yasar Zaman: store different products uh and then like you know add or subtract from them. Uh that's one common customization that I've seen at least. uh we only got this catalog in I think last month so it's not uh utilized as much but basically what it is is you can have different locations you can have different items in those locations and you can calculate the quantity that you have for that location.

00:36:06

Yasar Zaman: So if you wanted to let's say sell this item you can then on an invoice or an estimate pull from that specific item so it decreases the quantity on hand for that specific item in that location. And so that'll give that'll prompt you to know how much you have and how much you need to order and then how much you need to uh ask for a purch purchase order for. So this is kind of like the basic idea of it because it'll then translate into like the later projects which is
Elaine Chow: Okay.
Yasar Zaman: like okay if it's low create a purchase order for this if it gets to a certain point do this uh create a bill etc etc. But at like a basic level, this is something that a lot of customers that are in that business kind of ask for is like managing your inventory in different locations like like
John Miranda: by by business. What do you mean by that? Like what's Gotcha.
Yasar Zaman: manufacturing
John Miranda: Okay,
Yasar Zaman: businesses.
John Miranda: cool.
Elaine Chow: Is there also comment automations that you guys have been doing?

00:37:03

Yasar Zaman: Um it is but it's more generic in a sense of it applies to all all method um customers like estimate reminders for example, invoice reminders, things like that, right? Like we have cataloges for them. So if a customer does ask, we just uh Oops. We literally just plop this in and charge them three hours for it. So it's automations like that that we do customize for and then common ones you'd find on the
Elaine Chow: No.
Yasar Zaman: catalog. The catalog also the only thing with the catalog it doesn't show is the kind of account that it's for.
Elaine Chow: Mhm.
Yasar Zaman: So like we copy it copy it into accounts but it doesn't show you the type of account it is. So that you you'd basically have to either export methods like customer base and like do a VLOOKUP to figure out what this is. But that's that's a huge
Elaine Chow: Yeah, that's what I've been
Yasar Zaman: pain.
Elaine Chow: doing.
John Miranda: Yeah. So, I got a quick question like uh with the customers that you have like worked with specifically MWD uh what were their biggest like problems that they've like talked to you about?

00:38:14

Yasar Zaman: Uh I I think most of it is like u a lot of the features that they want aren't implemented into method or there's a lot of like bloatware in the things that are offered. For example, in the opportunities opportunities would be a great place to store like your projects itself, right? That's typically what it's used for is to store your projects. But the problem with opportunities is you need a close date, for example. Like why do you need a close date? we don't know when this opportunity is going to close, right? Or um having stages or something like that, probabilities, right? There's a lot of bloat in an opportunity that prevents a user from going into it and and finding it appealing for them, right? And so a lot of the common customizations revolve around can we just have, you know, a separate app that just gives us what we want, not necessarily like the closing date. We don't need that. We don't need opportunity lines. We don't need uh you know the next steps on an opportunity.

00:39:12

Yasar Zaman: We don't maybe need a lead source on an opportunity. Things like that. Just a like a dummy down version of it that we can use and apply. I think that's like the number one thing that I p at
John Miranda: Gotcha.
Yasar Zaman: least.
Elaine Chow: I'm laughing.
John Miranda: I was going to say like Brown Safe and Cure Fabrication, they I assume they don't use opportunities. They use their jobs and like that project thing to track.
Yasar Zaman: Exactly. Yeah.
John Miranda: I see.
Elaine Chow: How have you guys handled EDI?
John Miranda: Okay.
Yasar Zaman: Uh, I I don't know what that is to be
Elaine Chow: Oh, um what is it?
Yasar Zaman: honest.
Elaine Chow: So, essentially it's um if you're creating a sales order for um an external company, there's like an electronic explain there's an electronic way they're they're
Yasar Zaman: Oh, I remember right.
Elaine Chow: choosing to communicate with each other. Yeah.
Yasar Zaman: I I think I said it does not support any direct DD integration. Yeah.
Elaine Chow: Yeah.

00:40:08

Yasar Zaman: Yeah.
Elaine Chow: Yeah. Thank
Yasar Zaman: Uh they're curious about it. Like I don't know enough about it to give the like a solid answer,
Elaine Chow: you.
Yasar Zaman: but I know I've been asked this by two different customers them like they're one of them. And so there's no there's nothing we can do like we can't integrate or we can't like store all that sort of information. So it's like like the only answer I can give is like it's not possible.
Elaine Chow: Yeah. Okay. So, it has been asked by customers for EDI. Okay. Um, has anyone asked about the shipping portion?

Yasar Zaman: Yeah.
Elaine Chow: Because I know it looks like no one's really doing shipping with us. They're just making the the the packing slips or the uh the what are they called? The print slips.
Yasar Zaman: The release labels or whatever. Yeah.
Elaine Chow: Yeah.
Yasar Zaman: Yeah. I don't I don't think people ask like I've never heard about shipping to be honest.

00:40:59

Yasar Zaman: is more so like can method create the things that I need to then ship it out kind of thing. So can it really create the release labels?
Elaine Chow: Okay.
Yasar Zaman: Can it create you know all these different things that I can then just print out and put on my packages or something like that.
John Miranda: Have you dealt with like pickp pack processes as
Elaine Chow: Okay.
Yasar Zaman: Uh it's hard to because a lot of the time they they want the
John Miranda: well?
Yasar Zaman: barcode scanner, right? And so we can't like there's no way to support that. And so more often than not we have to say we have to come up with a different solution. We can't just you know if you want this uh package you can't scan it or something like that. Like it's literally not possible. So
Elaine Chow: Yeah, unless method has their own barcode
Yasar Zaman: yeah I
Elaine Chow: scanner.
John Miranda: Didn't you just implement like I don't know. I'm just thinking out of my head, but like uh I I know.

00:41:52

Yasar Zaman: promise you I tried everything. I promise you.
John Miranda: I
Yasar Zaman: I pro I promise you. I I I I told them like,
John Miranda: know.

Yasar Zaman: "Hey, give me three hours to research." And they're like, "Yeah, sure." And I said, "No, it's not
John Miranda: All right.
Yasar Zaman: possible."
John Miranda: All right. I was thinking maybe like a manual process. I don't know. They have to do double double.
Yasar Zaman: Yeah. No, it's it like the only thing that I thought of is like in method you can create barcodes and you can create um QR codes that store links, right? But that link would literally just open up something on your phone to look like a method website or something like that. So in theory, yes, it could, right? But they'd have to change their entire process to imp like implement that one thing. And more often than not, they have other places that use this barcode, for example. So it's like it's not it doesn't make sense for them to to just implement it to use in method kind of thing.

00:42:46

John Miranda: Yeah, know that sounds frustrating. Um, Elaine, if you have no other questions, I know we're over time,
Elaine Chow: Oh, no.
John Miranda: but uh,
Elaine Chow: Actually, I do have a few more questions.
John Miranda: okay, go for
Elaine Chow: Um, what is what is something that your clients have actually asked you that they wish that we had besides that you
Yasar Zaman: Um um honestly like any form of automation for reminders really like that's regardless of which um type of industry you're working with. That's probably like the number one thing that I've always been asked for is automations. Whether it's emailing customers or emailing users, right? Is just like an easier process to handle automation and setting up rules for automation, I guess.
Elaine Chow: Okay.
Yasar Zaman: And it's really really more so the reminders piece where maybe it could be an estimate,
Elaine Chow: Uh
Yasar Zaman: but it could also be like, hey, um, like the order date for this date is coming up, right? Uh, remember to go check up on this order or something like that.

00:43:54

Yasar Zaman: Like those kind of automations,
Elaine Chow: Mhm.
Yasar Zaman: those reminders.
Elaine Chow: Okay. And is there anything else um for more MWD specific clients that they've asked for?
Yasar Zaman: Um, I mean, aside from that one universal place, that's like uh just what they need kind of thing, that one app. Um, I would say it's pretty unique and specific. Like there's no there's nothing that's at least from the people that I've worked with, there's nothing that overlaps in a sense.
Elaine Chow: Can you remind me again about the one app that you were mentioning?
Yasar Zaman: It's basically the opportunities app where it stores your transactions and everything related to a project but including purchase orders,
Elaine Chow: Yeah.
Yasar Zaman: bills, work orders, even everything. But it's more specific to their uh uh
Elaine Chow: Mhm.
Yasar Zaman: project itself. Meaning they don't have unnecessary fields like a closing date, like a probability percentage, like a a pipeline amount, things like that. It's more so like this is the you know the project this is what we need these are the next

00:45:00

Elaine Chow: Yeah.
Yasar Zaman: steps and these are the transactions kind of thing and then here's a job costing of the entire thing
Elaine Chow: Would jobs be work for
Yasar Zaman: so yes and no I think jobs like it's I I can only
Elaine Chow: that?
Yasar Zaman: confidently say that jobs is very very useful for field services because uh like I've been working with John Sandy who's a partner right and um he's been working with this one
Elaine Chow: Yeah.
Yasar Zaman: customer who we're basically doing a job costing module where we're utilizing the
Elaine Chow: Yeah.
Yasar Zaman: jobs uh right there where we can then kind of figure out the

Elaine Chow: Mhm.
Yasar Zaman: job costing overall right so how much did you estimate how much did you actually work so how much are you paying your
Elaine Chow: Yes.
Yasar Zaman: workers versus how much are the customer making and then figuring out like the margin percentages and the breakdown of everything So something like this has been requested,
Elaine Chow: We because we're releasing invoice summaries soon.
Yasar Zaman: but
Elaine Chow: So that would be looking at the total estimated uh what you've estimated the actual work your visits and then I think you could probably take it and create job costing off of that.

00:46:18

Yasar Zaman: yeah. Yeah.
Elaine Chow: That'll be releasing very very soon within the upcoming month. So maybe something you can do for John
Yasar Zaman: for sure.
Elaine Chow: Sandy.
Yasar Zaman: Yeah, he's going to go crazy, you
Elaine Chow: He loves everything that we're doing.
Yasar Zaman: know.
Elaine Chow: excited for working with us. Oh, I love that you're working with John Sandy. He's amazing.
Yasar Zaman: He is.
Elaine Chow: Um, okay.
Yasar Zaman: Yeah.
Elaine Chow: And then final thing for you. Is there anything that you, if you could wish on a star that we could do for you? Because we have a full team of like developers behind us that you want us to be able to do, what would it be besides reminders for EDI and MWD specific, please? Thank you.
Yasar Zaman: Like honestly, I would it has to be the app, but I like if in a perfect world like if you can allow the user to make the app really
Elaine Chow: Mhm.
Yasar Zaman: easily in a sense of um customizing it to fit their industry in a sense of uh hey like what do you need to uh like house a project?

00:47:30

Yasar Zaman: Do you need purchase orders? Do you need estimates? All that and then it just adds it to the to the screen for you. Right? Do you need um like a date on it? A closing date?
Elaine Chow: Mhm.
Yasar Zaman: It just adds the closing date for you on the screen. So in in a perfect world, I would want like the customers to be able to select this is what I need. these are the apps I need and then it just plops everything on the screen and they can move around whatever they need to. So it kind of touches on that like one app piece because it's like it's just one
Elaine Chow: Mhm.
Yasar Zaman: app with whatever they need but in a perfect world they decide what they need and then it shows up on the
Elaine Chow: Okay.
Yasar Zaman: screen.
Elaine Chow: Is has it been an issue for them jumping from the different screens?
Yasar Zaman: Yes and no. Um yes in that like they might go like they might need to view an estimate for example or something like that right or view a work order right so it becomes a hassle to come into the same screen like using the same tab it goes directs you to that work order then you have to go back kind of thing um but

00:48:38

Elaine Chow: Mhm.
Yasar Zaman: like the only suitable um change for that because we can't really use the modals because it's too all is just to open it up in another tab.
Elaine Chow: Yep.
Yasar Zaman: So like yes, it is a pain, but there are workarounds that aren't perfect.
Elaine Chow: Okay. Okay. Would something similar to the way jobs is done be
Yasar Zaman: I think so.
Elaine Chow: beneficial?
Yasar Zaman: But I think with the jobs, um I know it's in beta still, so it's like um but if there's like a like a very clean way kind of like how the jobs handles it where it just

shows the specific details and be able to edit it on the spot,
Elaine Chow: Mhm.
Yasar Zaman: then yes, it would definitely be like a
Elaine Chow: Yep. Okay.
Yasar Zaman: plus.
Elaine Chow: Okay. Very cool. But yeah, thank you so much, Aar. I appreciate it. Always feel free to like message me or any of us um
John Miranda: I do got one quick question actually.
Elaine Chow: anything.

00:49:44

Elaine Chow: Sorry.
John Miranda: I got one quick question for you.
Elaine Chow: Yeah,
John Miranda: Um,
Elaine Chow: go for it.
John Miranda: I know you worked with a lot of MWDs, but like and you'd mentioned that a lot of customers have different requirements and asks or workflows, but if you could could you like try to find like a
Yasar Zaman: You're
John Miranda: similarity between the workflows or try to dumb it down to like this is how you see uh like the sim similar workflows between the companies that you worked with and like what are the core apps and method today that they use uh to accomplish their job to be done. Like it's it's a big ask. But like from your experience, what would this be?
Yasar Zaman: I can definitely like look into it uh a little bit more, right? Um, I can't say it off the top of my head cuz really all I have is like the estimates and like that sales order process, but I'm sure if I dig into some of my older accounts, I can find more similarities,
John Miranda: Okay. Yeah, sure.
Yasar Zaman: too.
John Miranda: Yeah. Uh you can just hit me up afterwards then when whenever you do have more insight. Cool.
Yasar Zaman: Yeah.
John Miranda: Uh all all good for me. Uh you guys good too.
