Inventory/MWD Discovery Call

Invited John Miranda David Singletary Barbara Stevenson Elaine Chow

Attachments Inventory/MWD Discovery Call

Meeting records Transcript File

Summary

John Miranda, DJS DIGITAL LLC, Elaine Chow, and Barbara Stevenson discussed DJS DIGITAL LLC's work with small to midsize manufacturers and retailers, detailing customer pain points stemming from a lack of central inventory systems and critical sales workflow steps, including the need for better reporting and automated alerts. John Miranda confirmed Method's solution is geared toward manufacturing, wholesale, distribution, and retail, which DJS DIGITAL LLC is interested in for its improving CRM and upcoming inventory functionality, emphasizing the need for ease of use, multi-location tracking with bin locations, and serial number tracking. John Miranda and Barbara Stevenson then demonstrated Method's enhanced inventory features, including multi-location management, visibility enhancements in transaction screens, and new reporting needs, while DJS DIGITAL LLC raised concerns about potential QuickBooks integration issues with quantity on hand and COGS tracking.

Details

- **Meeting Structure and DJS DIGITAL LLC Background** John Miranda outlined the meeting structure, suggesting to start with 30 minutes for learning about DJS DIGITAL LLC's experiences and customers, followed by a product demo. DJS DIGITAL LLC, who has been working with inventory management systems since 1997 and runs a practice for about five years, accepted the proposal, noting that they work with small to midsize companies, specifically manufacturers and

retailers (00:00:00). They primarily deal with inventory solutions, partnering with various providers like SOS Inventory and Katana (00:01:17).

- **Customer Profile and Solution Approach** DJS DIGITAL LLC defined their customers as generally having 50 users or less and less than $50 million in revenue, with varying operational maturity from paper-driven to having outgrown existing systems. They assist customers either with implementing specific inventory systems like SOS Inventory or by helping them find a suitable inventory management solution (00:02:42). For customers with an e-commerce presence, DJS DIGITAL LLC helps them integrate a robust inventory system, such as SOS or SIM 7, with QuickBooks for financials, as basic e-commerce solutions lack the necessary detail (00:03:57).
- **Typical Customer Workflow Example** DJS DIGITAL LLC provided a unique customer workflow example involving a roofing company that manages inventory in a warehouse and on trucks for on-site jobs, which is different from most companies that only manage inventory for delivery that returns empty (00:05:16) (00:07:55). This workflow starts with a customer order, which a project manager then processes in a system like Inflow, followed by the warehouse manager picking the materials using a barcode scanner. The critical parts of this workflow involve tracking returns and managing add-ons when more parts are needed on-site, as the truck typically returns the next day (00:06:26).
- **Common Pain Points Before DJS DIGITAL LLC Intervention** Before DJS DIGITAL LLC's involvement, customers often experienced friction due to a lack of a central inventory system, relying on spreadsheets, antiquated systems, and paper, which leads to slowness and mistakes (00:09:04). A specific example involved a chemical company that previously used a very old system and paper for all processes, resulting in no clear tracking of ordered, received, or stocked materials and a single person holding all formula knowledge, creating a significant bottleneck (00:10:27) (00:13:24). After implementing SOS Inventory and connecting it to QuickBooks, the company streamlined their workflow, eliminating paper and providing visibility for the owner to monitor operations remotely (00:12:07) (00:14:34).
- **Critical Sales Workflow Steps and Reporting Needs** DJS DIGITAL LLC identified the most critical steps in the sales workflow as knowing if there is stock to fill an order, creating a purchase order if stock is insufficient, and alerting the customer when the product arrives (00:14:34). Key reporting needs for manufacturers and retailers include having good reporting, dashboards, min/max levels, reorder

points, automated alerts for low stock, lead times, gross margins, and various sales reports (by customer, location, or product) (00:22:46). DJS DIGITAL LLC also asked if the development focus was on retail or manufacturing, and John Miranda confirmed the solution is geared toward MWD (manufacturing, wholesale, and distribution) and retail, with the current showcase focused on wholesale distribution (00:23:48).

- **Method Feature Requests and Reconnection** Elaine Chow inquired about features DJS DIGITAL LLC wished Method provided beyond inventory, to which they highlighted the need for automation, specifically automating workflows and updating fields automatically based on certain events (00:17:22). They also noted that they reconnected with Method to stay current on product changes and capabilities, particularly the improving CRM features and the upcoming inventory functionality (00:18:46). DJS DIGITAL LLC suggested that functionality similar to sales cycle funnels, sequence emails, and alerts found in other CRMs would be helpful, which Elaine Chow noted sounded like Method's opportunities app (00:21:34).
- **Key Requirements for Promoting Method** John Miranda asked what DJS DIGITAL LLC would look for in Method to promote it to their customers, and they emphasized ease of use and intuitiveness, such as the ability to quickly add customers and vendors on the fly while creating an order. Other necessities include easily looking up stock on hand, managing multiple locations with bin locations, and tracking products via serial numbers (with future needs for batch numbers and expiration dates for manufacturing) (00:25:12). DJS DIGITAL LLC stressed the importance of communication and visibility, including the ability to email various orders and potentially having a customer or mobile salesperson portal to view order statuses (00:26:25).
- **Current Inventory Solution Development and Problem Statement** John Miranda acknowledged that many of the requested features are being addressed in the development pipeline for Method's inventory and CRM, with work accelerating since 2025 (00:27:41). They explained that a core problem being addressed is the lack of clear visibility and control of inventory data in Method, noting that currently, quantity on hand is only visible in the item list or specific item screen, not within key transaction points like sales or purchase orders (00:28:43). This lack of visibility causes operational risk and friction, leading customers to rely on manual workarounds (00:29:54).

- **Multi-location Inventory Management in Method** John Miranda demonstrated the multi-location management aspect of the new inventory solution, which includes calculating the total quantity in stock as a summation of all location quantities per item. Users can assign and track inventory in multiple locations, such as various warehouses, and create new locations directly from the item screen (00:30:55). The feature also includes stock adjustments to log gains or losses of inventory at specific locations, maintaining a log of all such adjustments (00:32:04).
- **Visibility and Workflow Enhancements in Transaction Screens** Barbara Stevenson presented the prototype for enhanced workflow visibility in transaction screens, showing that sales orders will now display ties to invoices and delivery statuses (fully, partially delivered, or open) (00:34:28). Within a new sales order, users can view the total quantity of an item across all locations and select the specific source location (00:35:37). The system allows for partial delivery and partial invoicing of items, maintaining visibility of item division and status (e.g., invoiced status, ordered quantity, delivered quantity) on the transaction table (00:36:36). A similar flow is being developed for purchase orders, allowing for partial billing and partial receiving, and conversion to a bill (00:39:24).
- **Future Development and QuickBooks Integration** John Miranda confirmed that the item list screen will be enhanced to include columns for quantity available, on purchase order, and committed, distinguishing between "on hand" and "available" quantities (00:40:22). Regarding reporting, John Miranda stated that more discovery is needed, as reporting in Method requires attention, but it is envisioned as a must-have for the inventory solution (00:41:15). DJS DIGITAL LLC raised concerns about QuickBooks integration, noting that the quantity on hand tracked in Method is intended to be a Method-only number reflecting physical stock movements, separate from QuickBooks Online's accounting movements (00:42:34). Stock adjustments made in Method would be Method-only, while the financial value of receiving stock would still sync to QuickBooks, which could lead to differing quantity numbers between the two systems (00:44:02).
- **Costing Method and System of Record** The discussion on QuickBooks integration continued with DJS DIGITAL LLC expressing concern about potential issues with Cost of Goods Sold (COGS) tracking, which other inventory systems often avoid by disabling QuickBooks' tracking. John Miranda clarified that the new solution is not expected to impact COGS because Method's inventory is

mainly impacted by purchase orders and sales orders, though the customer will be responsible for ensuring accurate quantities when numbers differ (00:45:16). DJS DIGITAL LLC also inquired about costing methods like FIFO/LIFO, which John Miranda stated are not currently included in the design, but Method is aware of this gap and plans to iterate towards delivering this value after the initial launch (00:47:56).

- **Conclusion and Next Steps** John Miranda concluded the discussion by noting that the team is aware of the current gaps, and DJS DIGITAL LLC found the solution to be a good start. John Miranda confirmed that there is no current ETA for the general availability launch but partners and customers will be notified via email when it goes live (00:41:15) (00:48:58). John Miranda also requested DJS DIGITAL LLC to complete a short survey on the 2025 roadmap items for inventory, and offered to keep them in the loop for future testing opportunities (00:50:19).

Suggested next steps

- [ ] Elaine Chow will send an email to DJS DIGITAL LLC if she has more questions.
- [ ] John Miranda will send a quick survey to DJS DIGITAL LLC after the call to understand the value of work in the 2025 inventory roadmap.

Inventory/MWD Discovery Call - Transcript

00:00:00

John Miranda: All right. Okay. So, it's transcribing and recording right now, but um yeah, I guess like uh kind of how like the structure we can take this meeting if you're up for it is uh we can spend like the first like 30 so minutes or less learning more about you, your experiences, um who you work with, like the customers, your workflows. Um, and then we can like transition into like the product demo and we can showcase what we're building and what's coming for customers for inventory. How's that sound?
DJS DIGITAL LLC: Uh, that sounds good.
John Miranda: Yeah.
DJS DIGITAL LLC: Uh, should take 30 minutes,
John Miranda: Cool.
DJS DIGITAL LLC: but I'll I'll do my best. Uh, well, I mean, I've been um in the space working with inventory management systems since 1997. uh I've worked for uh software companies uh that focus strictly on inventory management systems and ERP systems. Uh I started my own practice about five years ago. Um so I'm working with you know small mediumsiz companies.

00:01:17

DJS DIGITAL LLC: Uh I deal a lot with manufacturers and retailers. Uh, I partner with several different inventory management solutions. Um, like SOS Inventory. I think that's probably uh, one of the companies years ago that I knew that uh, has a connection with QuickBooks. And I know you guys had a a demo with them like several years ago. uh Tatana uh MRP easy uh you name it. I work with a whole host of uh partners. Inflow is another one. S7. So most of my co customers are looking for inventory solutions. I'm not strictly inventory, but that's I deal with it probably the majority of the time.
John Miranda: That's awesome. And you mentioned that like uh some of the customers you work with today are manufacturing and vertical based. Is that like uh your expertise

like those uh industries?
DJS DIGITAL LLC: Uh manufacturing and retail. Yeah.
John Miranda: All right. Cool. Um you also mentioned that you're you're solving their point of like inventory systems and you work with like Katana SOS.

00:02:42

John Miranda: Are you looking uh as a are you looking for like an integration with these platforms with their current systems or like you're offering these like solutions for their needs?
DJS DIGITAL LLC: So, people are either coming to me with, "Hey, uh, can you help us implement SOS inventory?" Or they're asking me, uh, you know, we're looking for inventory management system. Help us find one.
John Miranda: Makes sense. Cool. Um yeah, I guess we'll jump into more inventory um later on. Uh but uh speaking about like the types of customers that you do work with um how would you describe like their size and like their operational maturity? like you know I know you mentioned like small midsize businesses but could you a
DJS DIGITAL LLC: I know that that's a that terminology is relative,
John Miranda: lot
DJS DIGITAL LLC: right? Uh so I would say uh 50 users or less and I would say 50 million or less that I'm working with now.
John Miranda: Oh,
DJS DIGITAL LLC: Yeah.
John Miranda: how many?
DJS DIGITAL LLC: Uh,

00:03:57

John Miranda: Oh, sorry.
DJS DIGITAL LLC: and maturity varies. It could be someone that's been around for 30 years and they're paper driven
John Miranda: Continue.
DJS DIGITAL LLC: and they need to automate. Uh, or they're on a system that they've outgrown and need to expand to something else.
John Miranda: Nice. And um for these uh types of customers that you've most recently

worked with, like what's the typical uh end-to-end workflow uh look like um uh for like the manufacturing retailer uh
DJS DIGITAL LLC: Um I mean they they do vary a lot.
John Miranda: customer
DJS DIGITAL LLC: I mean some of them have a eer e-commerce uh presence and some of them don't. So the ones that have e-commerce, they need to, you know, be able to uh sell their products online but also manage the inventory in a system that, you know, like Shopify has a basic inventory uh solution, but it doesn't go into the details that they need. So they need something that can handle it. So they'll, you know, use an SOS or a SIM 7 that has a more robust system, but also with the ability to integrate to QuickBooks for their financials.

00:05:16

DJS DIGITAL LLC: Um, and you have some people where there there isn't a e-commerce uh presence and they just need to manage their inventory because they're either uh so I have a customer right now I'm working with. They are a roofing uh company. U so they don't sell online but they have a warehouse, they have inventory, and they need barcode. So, they need to be able to manage the inventory. You know, when they they enter an order for a customer that's getting a new roof, they need to get all the supplies and everything for that roof. And they have vans or trucks that uh they bring to the site. So, they need to know inventory that's on in their warehouse, in their truck uh for that customer. So, that's an example of someone I'm working with right now.
John Miranda: Gotcha. And like uh would you say that their workflow starts from an order? Like you mentioned that they get an order for some materials and then they have to figure out uh how much inventory do they have.

00:06:26

John Miranda: Is that accurate?
DJS DIGITAL LLC: Yeah. So in this case, they have a new customer. They need a new roof. So they have a project manager that comes with all the materials that they need. So they create an order. That order is then placed into uh their system. In this case, it's inflow. Uh the day uh a couple days before the job is to happen, they have uh the warehouse manager will pick all the products um using a barcode scanner uh and then

the project manager will take those products and put it in their truck and then take the truck to the site and drop it off. Now, when they complete the order, it's either uh typically it's the next day uh because sometimes there are pieces they don't need. So, those returns will be handled the the next day because the truck typically doesn't come back that same day. So, they need to be able to uh track returns uh you know because or add on to uh the order because you know they find out when they get there they're they need more parts.

00:07:55

John Miranda: makes sense. And uh in that workflow that you provided um were there multiple personas that are acting like I know you mentioned a warehouse manager um but uh who would be the type of person initiating like the order itself? Was that the project manager?
DJS DIGITAL LLC: Yeah, the prosecution.
John Miranda: Okay. Okay. And um if you were to like uh scope out um from this type of workflow and you look at like the other companies that you've helped uh is this workflow similar or in in any ways or different from how other companies would be operating?
DJS DIGITAL LLC: I think they're unique because they have the uh the mobile the trucks, right? Most people are not managing inventory in the warehouse and on trucks. So,
John Miranda: Mhm.
DJS DIGITAL LLC: a lot of companies are they may have their own fleet of trucks for deliveries, but they're they don't maintain inventory on the truck. It's put in the truck for delivery and then is delivery. So, the truck should come back empty.

00:09:04

DJS DIGITAL LLC: So, that case is unique. Uh or there's some people that don't have trucks at all. They use uh like a ship station or something like that. So they use UPS or some other ground service to uh ship products because the products are you know B to C and customers go online and order it.
John Miranda: makes sense. Um, with respect to like these types of workflows, uh, where do you see things going wrong or where is like the most friction or attention required?
DJS DIGITAL LLC: Uh before or after I do

John Miranda: Uh, sorry, I missed it.
DJS DIGITAL LLC: I said before or after I handle
John Miranda: Um,
DJS DIGITAL LLC: them.
John Miranda: well, before you handle them, before you get involved.
DJS DIGITAL LLC: Uh I think a lot of it is either they don't have a system in place. They're using spreadsheets to keep track of everything. uh or maybe they're on an antiquated system where they use a combination of that system, spreadsheets and paper. So they don't have a central place for uh inventory.

00:10:27

DJS DIGITAL LLC: So they can see everything. uh it takes them a lot longer to get things done because they're relying on paper and a lot of things happen mistakes could happen because of that. Uh so or they have let's say a CRM and it doesn't talk to the inventory system. So there's this disconnect and they have to enter things in multiple times. So hopefully after I'm done with them, uh, they have a better inventory management workflow, uh, whether it's connecting their CRM to the inventory system and to their accounting system so that everything flows in the right direction and there's less reliant on paper.
John Miranda: Do you have like any specific example uh other than like the the re um uh the roofer example like somewhere some another example like with this uh pain that you just mentioned
DJS DIGITAL LLC: Uh, sure. I mean, I've done this for like 450 people. Um, so there was a company that um they handle uh chemicals. Um, so they had a very old system and none of the formulas were ever in their system.

00:12:07

DJS DIGITAL LLC: So they would just kind of do things like after the fact. So they really did have tracking of materials that they ordered, received, and had in stock. and everything was paper driven like they had paper for everything. So, um I implemented SOS inventory for them and connected to their QuickBooks. So, now orders are placed to the vendors. Uh well, you know, a customer places an order uh they're they'll able to see if they have stock or they need to create a new formula. If if it if they don't have the

proper materials, then they place a purchase order for it. That goes to the vendor uh comes in, they receive it. Uh that invoice for the receipt goes to QuickBooks so that their accountants and then pay it. The materials are received in. They know that they have it. Now they can ship it to the customer. So everything is now talking. So before every step was uh a paper document to move thing from A to B. Now all that paper is gone.

00:13:24

DJS DIGITAL LLC: Everything is now driven uh through SOS.
John Miranda: That's great. And um well before SOS was like implemented um you were mentioning that they use like paper pen some like manual work around for this right? Um what was like the impact impact of this? Did did it impact their operations in any way? Um delays or etc.
DJS DIGITAL LLC: the previous workflow.
John Miranda: Yeah. Like their previous
DJS DIGITAL LLC: Yeah. They had no uh idea how much inventory they had at
John Miranda: work
DJS DIGITAL LLC: all. They didn't know what their formulas were. They had one person uh that had all the formulas in their head. So if they had to ask how to create something, they had to ask this one person. So if that person get hit by a car, it's everything's gone. So now all their formulas are in the system. They don't really need to rely on that person um to ask about formulas anymore.

00:14:34

DJS DIGITAL LLC: They don't have all the paper
John Miranda: So it's B nice.
DJS DIGITAL LLC: anymore.
John Miranda: So it's basically like a big bottleneck that they were able to relieve with this SOS implementation that you added in.
DJS DIGITAL LLC: Yeah. And the owner of the company who is who lives in a different state like four hours away instead of having to drive in the office because he didn't always come into the office but he had to because everything is paper driven. Now he can just log on and see what's going on.
John Miranda: nice. Um going back to like the whole workflow you mentioned

something you were saying like order um and then you have like the shipping process and then you like collecting the payment with the invoice. Uh in that specific workflow um which which steps or step would be the most critical.
DJS DIGITAL LLC: It's for the purchasing or the
John Miranda: Um yeah, the sales I believe.
DJS DIGITAL LLC: sales.
John Miranda: Yeah, sales.
DJS DIGITAL LLC: Uh, I mean for sales it's if they're placing orders, they need to know if they have stock to fill the order.

00:15:58

DJS DIGITAL LLC: And if they don't have enough stock, they need to be be able to create a purchase order to order it from the vendor. And they need to be alerted when that product comes in so they can let the customer know, hey, your product's in. Let's schedule a delivery or schedule a shipment. And then they have to if it's if they're paying for it, you know, that order needs to either go to QuickBooks ahead of time so that the vendor so the customer can pay for it in advance if they're not using the ecommerce platform. With the e-commerce platform, nine times out of 10, the C customer is already paid for it, right? So they have to understand uh you know is this order paid for before it's delivered.
John Miranda: Nice. Um, before like I continue, uh, Ela and Barbara, do you guys have any like questions you have on your mind you want to ask?
Elaine Chow: Something I'm curious about is is there anything in particular from beyond the inventory solutions that you've applied um is there anything that we don't provide out of the box that you really wish we did?

00:17:22

DJS DIGITAL LLC: What
Elaine Chow: Yeah.
DJS DIGITAL LLC: method?
Elaine Chow: With method, this is your wonderful opportunity to say your wildest dreams.
DJS DIGITAL LLC: Not take my wildest dreams. Uh I I

Elaine Chow: Yeah.
DJS DIGITAL LLC: guess and I had this conversation uh about the around the automation part like automating
Elaine Chow: Mhm.
DJS DIGITAL LLC: workflows uh updating fields automatically when XYZ
Elaine Chow: Mhm.
DJS DIGITAL LLC: happens those type of uh automations I think would be helpful.
Elaine Chow: Okay. And then um is there are there screens today that uh within the existing workflow that you mentioned um that requires a lot more customization to help you meet your end goal?
DJS DIGITAL LLC: Uh, ask that again. Give me like the
Elaine Chow: Yeah, I can actually provide you an example. Um um certain people will customize a method and they'll create
DJS DIGITAL LLC: Okay.
Elaine Chow: a brand new app. So for example, if um they're trying to focus a little bit more on um let's say the purchase order side and all those intricate interactions.

00:18:46

Elaine Chow: Let's say they're purchasing from multiple suppliers and they're customizing that entire thing. Is there something like that that um that you've been struggling with?
DJS DIGITAL LLC: Uh, no. I mean, I haven't really implemented method with a customer that uses inventory. if that's what you're getting to. I I mean I do work with other CRM tools uh and some of them already have integrations with some of these products. So I I've I've used those other products for those type of
Elaine Chow: Uh what about beyond
DJS DIGITAL LLC: scenario.
Elaine Chow: inventory?
DJS DIGITAL LLC: Um, I mean, I've I've worked with accounting systems, CRM systems. Um, just to give you context, like I I haven't I haven't really been working with method for a while. Uh, and I reconnected at the beginning of the year. That's kind of how this conversation kind of got started. So, uh, if you're asking me about using method with other customers, I don't have a lot of examples of that.

00:20:19

Elaine Chow: Okay. Sorry. Go ahead.
John Miranda: I was just going to ask like uh do you mind asking do you mind me asking like why now?
Elaine Chow: Done.
John Miranda: Why reconnect with me now?
DJS DIGITAL LLC: Uh I mean I'm still a partner and you know I just wanted to see you know how the product has changed what other uh capabilities there are because if there's an opportunity to uh implement it I just want to make sure I I'm up to date with everything.
Elaine Chow: No, I think that's really cool.
John Miranda: Nice.
Elaine Chow: Um because I think today we're improving our CRM features. We'll be implementing the new inventory that John will be demoing in a moment. Um right, how we have sales orders, invoicing items, purchase orders, all natively within method. Um, so I was always just curious if there were things that you wish were not provided um with
DJS DIGITAL LLC: Well,
Elaine Chow: method.
DJS DIGITAL LLC: and you can answer this question if I'm not up to date on everything, but you know, if you're looking at other CRM, right?

00:21:34

DJS DIGITAL LLC: They have uh they have these funnels. They can they you create a lead and this lead can go through different stages of the sales cycle, right? You can send emails, you can create uh sequence emails based upon a certain thing. Um there's alerts that can go to different people. So I I'm not sure if you know out of the box that functionality is there.
Elaine Chow: It does sound a little bit like our opportunities app.
DJS DIGITAL LLC: We're pretty
Elaine Chow: I know our CRM team is trying to make big improvements uh and opportunities to make it a little more advanced. Um but yeah. Okay.
DJS DIGITAL LLC: Sure.
Elaine Chow: And then sorry go ahead
John Miranda: Oh, no. Ela,

Elaine Chow: John.
John Miranda: go ahead. I was just gonna say something. I'll say it
Elaine Chow: Um yeah I think these are some of the questions I had at top of mind.
John Miranda: after.
Elaine Chow: Um if I have more questions would it be all right if I send you an email?

00:22:46

Elaine Chow: Okay awesome. Uh I'll throw it back to John.
John Miranda: Thanks, Ela. Uh I know before we start the demo like one question that I had in mind was I know we were talking a lot about the problems around inventory with your customers and their solution and the solutions you implemented um regarding that workflow that you described. Is there any other like problems um outside of inventory that we should be aware of that that they're facing every day?
DJS DIGITAL LLC: Um, you need to have good reporting. Um, they need, you know, if you have a dashboard would be great. Uh,
John Miranda: Okay.
DJS DIGITAL LLC: but they need to know, you need to be able to have, um, minmax levels. You need to have reorder points. You need to automate that. So, they need to know, uh, when they're low in stock. They need to be alerted of it. uh they need to know lead times, how long it takes to get that product from that vendor.

00:23:48

DJS DIGITAL LLC: Uh so they're they're assuming those types of uh reporting is there you know gross margins uh on orders u uh if they do commissions are there commission reports sales reports you know sales by sales by customer sales by location sales by product you know showing gross charges like these type of reports are very important to manufacturers and retailers. Like you talk about so are you guys looking just at retail inventory or are you looking at manufacturing as well?
John Miranda: uh we're looking at MWD so manufacturing, wholesale and distribution and retail. So uh we that was basically like the overall um but the solution
DJS DIGITAL LLC: Okay.
John Miranda: that we will be showing you is focused more on the wholesale distribution

DJS DIGITAL LLC: Okay.
John Miranda: side.
DJS DIGITAL LLC: Cuz when you talk about manufacturing, you're adding a whole another complexity with bill of materials and things of that nature.
John Miranda: Yeah, it's a whole another ball league of yeah complexity. Uh which is why the solution was heavily geared towards wholesale distribution for like uh MVP.

00:25:12

John Miranda: Um and uh one question I wanted to ask before we move on is uh if you were to start um I guess promoting method to your customers, what would be the things that you would be looking for? um in method to start you know sharing hey method can do this or this is this is the solution that you're been looking
DJS DIGITAL LLC: um uh ease of use. It has to be intuitive for the customer. Um they shouldn't have to click multiple times to get you know an order through. There has to be uh you know if they're creating an order uh and the customer is not there, they should be able to add a customer on the fly. They should be able to enter vendors on the fly. um you know, they should be able to easily look up quant on hand as they're entering an order before they put the product in or at least put the product in and see what's available. Uh they need to be able to have multiple locations and have bin location with those within those locations.

00:26:25

DJS DIGITAL LLC: So, as they're receiving stock, they need to be able to find out where exactly it is in the warehouse. Um, you know, serial tracking. Can they track the product by it serial number and where it's gone? You know, eventually when you get to manufacturing batch batch numbers and expiration dates, you know, those type of things. So uh those are some of the you know basics you know emailing orders, purchase order, sales orders to customers, you know maybe the ability to have a portal so a customer can log in and see the status of their order instead of having to call, you know, same thing with salespeople. of their uh maybe they have um remote salespeople or mobile salespeople be able to enter an order from wherever they are and to be able to look up the status of that order instead of having to call someone in the main office of what's going on with this order kind of thing. Communication and visibility are very

important.
John Miranda: Yeah.

00:27:41

John Miranda: No, thanks for summing that up. Um, a lot of those things are things that we are aware of from the inventory standpoint as well as from the CRM standpoint. And um since 2025 at least there has been uh um the ball's been rolling in that direction to improve that overall experience for our end users. So uh hopefully um you'll be able to experience these things um that we've been working very hard on. Um but uh before I start the demo, Elaine, Barbara, anything you want to start ask?
Barbara Stevenson: Y'all y'all have basically covered everything for me.
John Miranda: Cool. Awesome. Uh, okay. I'll, uh, start sharing my screen and we can just do a quick, uh, product demo. Um, I'm going to do, uh, part of it, then Barbara's also going to jump in as well. Okay. Give me one sec.
DJS DIGITAL LLC: Is Is this like a a beta or is it not that far?
John Miranda: Uh, this is in development, so we're not at the beta phase. Uh, we're going straight to GA,

00:28:43

DJS DIGITAL LLC: Okay.
John Miranda: but that's at a later date to all customers. Yeah.
DJS DIGITAL LLC: Okay.
John Miranda: All right. Give me a sec. All right. So, everyone can see my screen. Okay. Cool. So um one of the core problems that you are addressing or mentioning about with the solutions that you've been providing to your customers are you know the lack of clear visibility and control into your inventory data and that's the main problem that we're addressing with our inventory solution. Um and I'm not too sure how aware you are but inventory is basically non-existent in method. Um the only real area where you can see your quantity on hand or your quantity on hand for any item is from the item list screen as well as the specific item screen for that item. Right? Nowhere else on the platform in specific like sales orders uh purchase orders or key transaction points can you actually see your quantity on hand which is extremely crucial uh during the sales process.

00:29:54

John Miranda: And um you can imagine why like um you obviously have experience with this. Your customers have voiced it. Okay. Um, this really causes a massive like operational risk as well as friction for customers because like you mentioned, they would have to use um a pen and paper to actually figure out how much that they have on hand or available to sell or maybe they're using like an IMS software already and they have to go to a different website, check how much you have, go back, confirm that, hey, you can actually fulfill this amount or they have to call the warehouse manager and confirm with them. So there's a so much more manual workarounds when these types of primitives should be available at these specific points in time to confidently sell um and close deals efficiently. So now that we really understand the problem that we've been addressing like the solution that we implemented is um is a multi- workflow solution. So if you go to like the items app um you can see uh this new this screen it's almost identical but there will be some new things being added.

00:30:55

John Miranda: is still in active development. Uh when we create a new item, uh we're going to do inventory part items because these are the items that we track uh by quantity. Uh let's say the item that we want to create is um I don't know, iPad uh 11th J. And then uh so we have a total quantity in stock. So this field is basically autopop populated uh and it's a summation of all your location quantities u per location. So we can just click we can create an asset amount in income account. These are just required fields. But then now we also provide the ability to actually uh manage by location per item. So if you have an iPad 11 gen, you might have that in multiple locations or warehouses. So you can actually assign these locations to the specific item. So um let's say one's in warehouse Ajax. Let's say you have a thousand quantity in stock in this location. You can also add multiple locations. So let's say warehouse Toronto, we have only like 50. This is like the starting stock for this iPad.

00:32:04

John Miranda: And you can even create new locations from this screen too. So let's say warehouse um uh would be would be and then let's do warehouse would be save and close and then your new warehouse has been located. You can create a new you can add that new location directly from this dropdown warehouse would be and then uh let's say there's 2,00 here. You save and then it's still a little buggy so bear with me here but you can see here that the quant total quantity in stock actually updated to reflect the summation of all the quantities in each location. Uh from the screen you can actually also do uh stock adjustments. So maybe you lost some inventory or um you gained inventory for some whatever reason you can provide a reason for adjustment. uh new shipment. Um and you can choose your location. So previously we had where Jack warehouse Ajax Toronto and Whippy. If we do warehouse Ajax, you can see that the quantity in stock here automatically updates to show that you have a thousand here.

00:33:14

John Miranda: But you can also adjust by positive or negative. So if it's a positive, let's say we actually got 500 more for some whatever reason, new shipment, you save and close. Um, and then yeah, so I think it's a little buggy, but it should uh autopop populate to show that it did increase by 500. Uh, something's going wrong, but you got kind of get the idea. So when we go back to um this screen here, we can actually see the adjusted stock tab where it shows um yeah iPad 11 gen quantity adjusted by 500 by new shipment. So you can actually keep tabs and see a log of all the quantity adjustments, stock adjustments uh to inventory. You can also manage all your locations here. So warehouse Toronto, it has all the list of locations. You can click into it, you can update the names, you can add addresses, save them back to actually uh and it would update everywhere where that warehouse is reference. So that's basically like how whole multilocation management aspect of inventory as well as how stock adjustments work as well as item location linking between inventory items and a location.

00:34:28

John Miranda: Um now Barbara can show you the actual workflow where we um bring visibility into the transaction screen for sales orders and purchase orders.

Barbara Stevenson: Hi, I'm going to walk you through sales orders. So, it's just a prototype on Figma. So, bear with us for now. Please let me know where you can see my screen.
DJS DIGITAL LLC: I see
Barbara Stevenson: Good. All right.
DJS DIGITAL LLC: it.
Barbara Stevenson: Um so what you would notice here is uh currently what exists on our sales order table is just your date created the order and the date it's due essentially. But what we've added now is um you're able to tie your invoice to your sales orders and you you could have fully delivered or partially delivered a particular order or you could have opened it and you know no action on it yet. So this is something we didn't have a method before um that that's going to be coming up. So let's show you what it looks like now for creating a new sales order. So you create a new sales order.

00:35:37

Barbara Stevenson: This is already filled. And then we have our items. So what is new here? Actually, let me see. Yeah. Okay. So the new thing here is on our items table. On an items table, you select an item. You're able to view the total number of items in a particular location. And then you're able to select that particular location. And like I said, you could choose to deliver all those items or some of those items. So in this situation, we're going to be going through hair wax, right? So you selected and imagine you've already selected hair wax, right? And you want to view how many you have in your total location. So by the time you click this, you're able to see that you have um 200 in the junction, nine in hive, five in lower tower for example, right? So you have an idea already. So um when you click the drop down, the locations are not tied to it. So that's why we had to use the model because um due to engineering constraints we can't actually surface the locations in the drop down although that's like what's expected.

00:36:36

Barbara Stevenson: So let's say you've already seen the total right. So you click on the junction it now populates your available quantity and you know that there's 200 but you want to sell 12 right you enter your rate amount tax etc all that's already there today. So in this scenario you want to deliver but you want to deliver say six out of 12 items. Um

you click deliver. you have the option to deliver partially or deliver fully. In the event where you want to deliver partially, we tell you the items to partially deliver and it shouldn't um exceed the items available stock. Right? So here you want to say deliver say six items. So you click on six items and then you save. We tell you that it has been completed successfully. And then what you see here um is that it's been divided. Okay. So I don't know why it's showing this screen. Sorry. Give me a moment cuz that looks to be broken. Um, sorry.

00:37:31

Barbara Stevenson: I'm not sure why that's going on. But what we're supposed to see here is essentially hair wax um and a division between items not delivered and items delivered. This is showing a whole other prototype. So that's kind of confusing. Um, but the idea is that you're going to be able to um, you know, break down and sell as many items as you want. And you could always choose to undo whatever it is that you've delivered um if you haven't sent that out yet. So another scenario I could show you is say you want to create an invoice from that purchase order. So we have in your sales order in your sales order rather we have hair wax, hair comb, hair cream and you want to create an invoice. So now you can select the items you want to invoice. So, in this situation, you could choose to invoice three out of five items. Two out of five items. Um, in this scenario, you've decided that you only want to invoice these two items.

00:38:27

Barbara Stevenson: By the time you click save, um, it takes you to the invoice screen. And then, you know, this is everything we have today. The only addition to that this is that on the items table, we have our source location and quantity sold. Okay, that was just a noteaker. So, that's essentially it. Um on this table what I was trying to show I don't know why it did that is that on the item delivery table you can see whether um that item has been invoiced or not because you can select what items to invoice right so if it's been invoiced you have a yes or no and then we already tell you the quantity that um was ordered the original quantity and whatever quantity you wanted to deliver. So this way we're able to keep track as well as on the table we have where you're able to see whether or not it's been invoiced and the status of that particular order. Partially delivered in the sense that you may have you might have partially delivered it. Partially

invoiced in the sense that you might not have invoiced all the particular items tied to that particular order.

00:39:24

Barbara Stevenson: So you're able to view and um follow the status here. And it's the inverse for purchase orders. you're able to partially bill um your purchase orders. You're able to partially receive it as well. Exactly the same flow and you're able to convert your purchase order to a bill. So that's what we currently have in development to launch with multilocation management. Can you hear me? I can't tell.
DJS DIGITAL LLC: I can hear you.
Barbara Stevenson: Okay. Yeah. So, do you have any questions,
DJS DIGITAL LLC: Yep.
Barbara Stevenson: comments, feedback, or concerns? Um, we still have things coming like reorders, um, stock transfers, and we'll be iterating as we go on, but that's, um, the next few things we have coming after we get this running.
DJS DIGITAL LLC: Can we go back to the item list
Barbara Stevenson: Item lists,
John Miranda: Oh, I think that's I Yeah.
Barbara Stevenson: that's on your side.
DJS DIGITAL LLC: where John was showing?
John Miranda: Yeah, sure. I can uh share my screen.

00:40:22

DJS DIGITAL LLC: Yeah.
John Miranda: Give me a sec. Yeah. Yeah.
DJS DIGITAL LLC: So, are there any other columns you can add here
John Miranda: Yeah. Yeah. So, sorry. So, that's Yeah,
DJS DIGITAL LLC: like
John Miranda: there's going to be a lot more um I can pull up the designs, but you will have a quantity in stock. You will have a quantity available uh on purchase order um as well as uh committed. So, you'll see all of those uh quantities needed to make a
DJS DIGITAL LLC: Okay. Okay. Yeah,
John Miranda: decision.

DJS DIGITAL LLC: that's what I was just going to ask is this the distinction between on hand and available.
John Miranda: Yeah. Yeah. it it's just not have been built yet. That's an active development right
DJS DIGITAL LLC: Okay. And like the rest of the system,
John Miranda: now.
DJS DIGITAL LLC: you can customize it. So, uh I'm assuming the item record you can create custom

00:41:15

John Miranda: Oh yeah.
DJS DIGITAL LLC: G.
John Miranda: So like if there's something that our solution doesn't provide, um they can easily customize and add more value to their screens.
DJS DIGITAL LLC: Okay. And going on what I was saying before about like reporting like what what's your what's your plan for that?
John Miranda: Uh so we still need to do more discovery work around the reporting. Um reporting in general ad method needs a lot more love and attention. So um there's more work that needs to be done there. Um it's definitely something that we need we envision that the solution would have. Um it's almost like a mustave. Uh we just have to do more work to understand what's required what are the must haves for reporting in general. Yeah. But overall like um how's the solution look uh for your um to you today?
DJS DIGITAL LLC: I mean, it's a good start. I mean, you you have some of the basics down. Um, it's just a matter of adding um more features like you're saying with the columns.

00:42:34

DJS DIGITAL LLC: Um, that's that's kind of like a mustave. I'm assuming this the activity can be pushed to QuickBooks. Like if you're receiving stock, updates the inventory, that value gets pushed over to QuickBooks, right? Is that functionality part of this or
John Miranda: Um so a big thing to note is um the quantity on hand or the quantities that we track within method when inventory uh is enabled is only a method only uh number. So we you'll have a quantity on hand QuickBooks online and then a quantity in

stock method value. Uh so they could differ because we're tracking uh inventory movements from physical stock movements from sales orders and purchase orders whereas QuickBooks Online tracks accounting movements from invoicing and billing. So uh two separate flows uh but we're tracking the physical stock tracking.
DJS DIGITAL LLC: So they would have to manually update QuickBooks with new inventory that comes in.
John Miranda: Uh the inventory should sync. Um the sync that we currently have with the QBO would not change. We're just uh keeping the quantity on hand uh for inventory tracking a method only um field that wouldn't be impacted from QBO.

00:44:02

DJS DIGITAL LLC: Okay. So, if I place an order for $1,000 worth of calculators, I receive it in that $1,000 gets pushed to QuickBook.
John Miranda: Yeah, that that that that wouldn't
DJS DIGITAL LLC: Okay. And then if I do an adjustment and now I only have 900,
John Miranda: change.
DJS DIGITAL LLC: that adjustment is pushed to quickly.
John Miranda: So that adjustment would just be method only.
DJS DIGITAL LLC: Okay,
John Miranda: Yeah,
DJS DIGITAL LLC: there's there's
John Miranda: adjustment is not Yeah,
DJS DIGITAL LLC: where
John Miranda: like uh because I know uh Cubio has stock adjustments too and uh we have stock adjustments uh but since uh how we structured and built our solution is from physical stock movements uh we had to keep them separate. So that would be one of the cases where uh if a cubo stock adjustment was made that would that would reflect the cubio quantity in method but it wouldn't reflect our inventory quantity in method.
DJS DIGITAL LLC: Okay. So, let me ask a question.
John Miranda: Yeah.
DJS DIGITAL LLC: So, this calculator, so would this calculator be in QuickBooks as a inventory item?

00:45:16

John Miranda: Yeah, it would be. Yeah, you wouldn't you just wouldn't have your quantity install committed, expected, or available. That would just be tracked in method, but you would still have the quantity on hand. QBO amount which would be syncing birectionally.
DJS DIGITAL LLC: And have you guys ran into an issue with like cost of goods sold? Because most other inventory systems require that tracking Quon Hand and QuickBooks be turned off because they they can't handle both. Well, QuickBooks can't handle both. like it gets confused and end up overstating coin uh cost good
John Miranda: Yeah. So like um it shouldn't be a problem based on how we built it.
DJS DIGITAL LLC: sold.
John Miranda: Uh just because uh um when we are inventory for us is just impacted from purchase orders and sales orders. So the cost of goods solds um shouldn't be impacting our um our numbers. Uh but from a QBO standpoint, if they were to make any changes, then uh the QBO quantity on hand does get impacted.

00:46:36

John Miranda: If that answers your question.
DJS DIGITAL LLC: So it seems like they they have to do some stuff here and they're
John Miranda: Yeah. Yeah,
DJS DIGITAL LLC: finishing.
John Miranda: basically like uh if they like obviously inventory is not a linear process, but if they were to follow a linear process where they go from like the order, then they they ship it, then they invoice it. Most times it should be um should be um the same uh because you're invoicing what's already been delivered or received or and billing what's been received. Um but there there are opportunities where the numbers would uh differ and that's on the onus of the customer to ensure that their quantities are uh being reflected accurately but we will
DJS DIGITAL LLC: Yeah, I mean that's that's always going to happen, right?
John Miranda: yeah
DJS DIGITAL LLC: that the perfect world there's no issues but that perfect world doesn't exist.
Barbara Stevenson: That's
John Miranda: exactly
Barbara Stevenson: it.
DJS DIGITAL LLC: Um I guess my other question is costing method.

John Miranda: There
DJS DIGITAL LLC: Um are you do you guys have a costing method like a FIFO LIFO and

00:47:56

John Miranda: we do. Yeah. No,
DJS DIGITAL LLC: Okay.
John Miranda: that's not We didn't uh We didn't uh design for uh FIFO people. Yeah.
DJS DIGITAL LLC: Okay.
John Miranda: Yeah.
DJS DIGITAL LLC: So, where would So, if they're using this, this should be their uh system of record for what's on hand and the total value,
John Miranda: Yeah.
DJS DIGITAL LLC: right? If I have a million dollars worth of inventory, I should be able to come in here and see
John Miranda: You should you should um these are these are a lot of things that we would be iterating
DJS DIGITAL LLC: Okay.
John Miranda: towards
DJS DIGITAL LLC: Okay.
John Miranda: Listen.
DJS DIGITAL LLC: Yeah. Because then you have to obviously have a a costic method because to get the total value it depends on which cost method.
John Miranda: Uh for sure. Yeah, I know a lot of other IMS softwares provide options uh for which costing method you want to choose. Uh we don't have that today. Um once we the goal right now is to get this into customers hands and

00:48:58

DJS DIGITAL LLC: Okay.
John Miranda: get as much feedback so we can iterate and improve the product. Um these are things that we're currently aware of that are like the the gaps but we we do plan to eventually uh deliver that value.
DJS DIGITAL LLC: Okay.
John Miranda: Yeah.

DJS DIGITAL LLC: Yeah. Just those questions will
John Miranda: Yeah.
DJS DIGITAL LLC: come.
John Miranda: Um, anything else uh, David, that you want to you want to ask? I know we've been, uh, talking a lot, asking you a bunch of questions, but do you have anything for us as well?
DJS DIGITAL LLC: No, I mean I I see where the product is right now and I know that you guys have feedback on what needs to be And do you have a ETA of when it's going to be available?
John Miranda: Uh no ETA yet. It's uh still developing.
DJS DIGITAL LLC: Okay.
John Miranda: Yeah. Yeah. But when we do um partners,
DJS DIGITAL LLC: Okay.
John Miranda: customers will be made aware through an email update. So, um you will find out once it goes live.

00:50:19

DJS DIGITAL LLC: All right. Yeah.
John Miranda: Yeah.
DJS DIGITAL LLC: Thanks for show I mean if you have questions need some feedback feel free to reach out to
John Miranda: Yeah.
DJS DIGITAL LLC: me.
John Miranda: Yeah. For sure, David. And uh one more one last thing before we wrap up the call is that uh um like Barbara was mentioning how we have like stock transfers, other roadmap items coming up. I do have a quick survey that it would take literally like less than five minutes for you to complete. It's just to understand um the value of work in our 2025 2025 road map and h for inventory and how that would be impacted um moving forward uh based on these inventory roadmap items. And um it's just a quick yes no type of survey I can send to you after this call.
DJS DIGITAL LLC: Okay,
John Miranda: How's that sound? Cool. Um yeah, I really appreciate your time. Thanks for all the feedback,
DJS DIGITAL LLC: that's
John Miranda: the help here, and the insights regarding these workflows, MWD and inventory management. And uh we'll we'll keep you in the loop. I know you really want to

be part of inventory testing. So there's there will be a lot more in inventory improvements coming down the line. And we'll sure we'll be sure to reach out to you for further
DJS DIGITAL LLC: okay.
John Miranda: testing.
DJS DIGITAL LLC: Sounds good. It's nice meeting you guys.
John Miranda: Cool. Thanks so much, David. All right. Bye for now. Thank you.
